The missing primary carrier

An individual human being is neither an institutional category nor a disposable unit of capacity.

CORRECTION

The v0.1 scenario selector contained ten institutional and environmental settings but omitted the individual human as an independent receiving system and acting agent. This edition corrects that omission in the 120-domain library and navigator.

MANDATORY HUMAN ASSESSMENT

At each actual system interface, evaluate whether an individual human can be a source, receiver, operator, compensating carrier, protected person, or future self. Document affected people rather than substituting the names of institutions for them.

AVOID FALSE CLAIMS

For a purely physical event that does not demonstrably affect a human being, record the individual-human link as unobserved or not applicable instead of inventing a causal path. Scientific truth and human dignity both require this.

PROVENANCE

Rufino is the identified originating IAMF-P index case in the authored research history. This historical role is different from the inclusion of every other individual as a potential consequential carrier.

The human receiving state

The model must preserve the individual, not merely a service record.

PHYSICAL AND BIOLOGICAL

Bodily safety, health, energy, environment, mobility, disability access, nutrition, pain, life-course and physical capacity are distinct native outcomes.

COGNITIVE AND EXPERIENTIAL

Information access, learning, agency, mental well-being, trust, perception, choices and temporal attention may be relevant. Never infer unmeasured private experiences as facts.

SOCIAL AND MATERIAL

Income, housing, family support, institutional recognition, rights, social capital, dignity, employment and safety depend on identifiable human relations and policies.

TEMPORAL AND FUTURE SELF

The same human can receive consequences today and later; the burden may be hidden as unpaid work, reserve depletion, lost opportunities, or delayed needs.

PROTECTIVE PRINCIPLE

A good aggregate institutional result cannot erase coercion, exclusion or serious harm to a particular person. Consent, autonomy, fairness, and rights constrain the action set.

Rufino as originating IAMF-P index case

The author is a historical subject, operator, compensating carrier and architect.

DIRECT HISTORICAL EVIDENCE

The index-case history includes physical recognition records, professional experiences, founder-operated enterprise functions and documented financial movements. Their occurrence should not be casually relabeled a hypothesis.

OBSERVED INSTITUTIONAL HANDOFFS

Academic and work awards can serve as social legibility bridges, while later changes in institutional recognition and support are a separate set of lived and documented observations.

MECHANISM UNDER INVESTIGATION

How particular institutional transitions caused particular later burdens requires process tracing, dates, alternative explanations and source provenance; the person is not required to prove his existence.

RESEARCHER ROLE

The author remains a research originator and collaborator. His personal data are not reproduced in this public technical expansion, and a research institution does not thereby acquire authorship or ownership.

Person-to-institution and institution-to-person

A university, government or employer may have a KPI while a human carries an unrecorded outcome.

HANDOFF SEQUENCE

Demonstrated capability -> performance evidence -> recognized representation -> opportunity and protection -> continuing institutional support -> consequential human outcome.

FAILURE MODE

An institutional record may describe a transaction, credential, intervention or service as complete while the person bears unresolved financial, physical, social, or future consequences.

CONSTRUCTIVE DESIGN

Construct actual capacity around a person where justified: safe access, fair recognition, paid opportunity, health support, coordination, legal protections, resources and appropriately timed follow-up.

VERIFICATION

Obtain consented, lawful individual-level measures and compare against a suitable incumbent. Evaluate material protected carriers through time; do not presume a successful outcome from a better administrative metric.

The human in every domain without false universal links

The model must distinguish direct person effects, mediated effects, and no identified person effect.

DIRECT HUMAN INTERACTION

In education, work, healthcare and services, the individual may directly receive the action; record the relevant person and the real outcome.

INDIRECT MEDIATED PATHWAY

In environmental, engineering or digital domains, identify people only through credible physical, exposure, economic or institutional pathways, not by verbal analogy.

SCIENTIFIC OBSERVATION

In chemistry, quantum physics and cosmology, humans may be investigators, instrument users or downstream beneficiaries; this does not make subjective human effects a native quantity of a particle.

INCLUSION RULE

At every adapter ask who the human is, what can be observed, what can be constructed, and what would establish benefits and harms, including the legitimate answer that no individual linkage has been demonstrated.

Human-centered Mutual Uptick and safety

The object of the search is improved consequential conditions, not the declaration of success.

RECEIVING CAPACITY

Human agency is not equivalent to resources available to another institution. Capacities must be developed with appropriate participation, consent and non-coercive support.

RECURRENT RESEARCH

When a proposed solution is not demonstrated, identify the binding information, material, technical or legal constraint and the next legitimate action; preserve unknowns and unsuccessful results as research records.

ACCEPTANCE CONDITION

No human harm is silently canceled by a commercial gain; measure actual beneficial outcomes for protected individuals with uncertainty and time taken seriously.

REALITY CONSTRAINT

The commitment to search for better outcomes does not imply that every physical or ethical constraint has a feasible all-positive solution; do not manufacture an MU+ pass.

How to use the 120-domain human extensions

Six person-centered test scenarios are now included for each domain.

SIX TESTS

For each of the 120 domains the individual-human scenario studies capacity shortfall, representational mismatch, delayed effects, measurement uncertainty, coordination failure and inequitable distribution.

PAGE INTEGRATION

These 720 pages are inserted immediately after each domain foundation, ahead of the prior inter-domain analyses, not merely appended as an afterthought.

AUTHOR/SOURCE PRESERVATION

The original 1,170-page Canonical Atlas is maintained unmodified. The added sections are clearly identified as AI-assisted research-design supplements, not previously observed outcomes.

OPERATIONAL PROTOCOL

Choose a native domain; document the person-level pathway; define lawful data and comparison; design receiving capacity; evaluate actual outcomes; repeat as needed. An individual remains an independent carrier and agent.
