CANONICAL EDITION 1.0

THE UNIVERSAL REALITY ATLAS

A Consequential Systems Encyclopedia

LERM · IAMF-P · Mutual Uptick · K_R v1.1 · 120-Adapter Atlas

Jefferson Rafael Rufino

2026-10-09

One grammar, many substrates. A visual and numerical atlas for tracing consequence, finding the receiving carrier, building capacity before the transition, and verifying coexistence through time.

FOUNDATION 01

Reader contract

This book is designed as a journey from intuition to formalism to evidence to operation. It preserves the frozen K_R v1.1 kernel while expanding the domain ontology to include agency, choice, responsibility, consciousness, evolution and temporal coexistence inside the same consequential system.

Evidence discipline. Structural translation is not the same as empirical validation. A domain can compile cleanly into the grammar while the decisive prospective test remains open. The Atlas marks those states rather than silently promoting them.

Within the ontology of this book, consciousness is treated as present across substrates. The empirical frontier is how that consciousness instantiates, becomes legible, interacts and coexists through different substrates. This is an ontological premise of the Atlas, not a claim that contemporary science has already measured every substrate's subjective experience.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 02

How to use the Atlas

Each adapter is a seven-plate mini-chapter. Plate 1 names the native system. Plate 2 translates it into the frozen consequential grammar. Plate 3 exposes the domain language. Plate 4 works a numerical example. Plate 5 plays the transition through time. Plate 6 states the evidence and falsification logic. Plate 7 tells the reader exactly what to do next.

Three reading depths
1. **Journey layer:** plain-language system story.
2. **Technical layer:** equations, carriers, causal estimands and native terms.
3. **Operator layer:** preregistration, construction, retest and next experiment.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 03

The frozen consequential grammar

$$\Omega_t \to M_d \to X_t^* \to \Sigma_d \to G_\Sigma \to BDI \to D_a \to C, \Gamma, H \to \Delta R^* \to a \to MU^+ \to \text{retest}$$

The grammar does not require the same mechanism in every domain. It requires the same questions to survive translation: what is the evidence-grounded state, what schema is receiving it, where does a local action displace state, which carriers receive it, what capacity is missing, what must be built before action, and does the consequential system pass the carrier-specific Mutual Uptick gate afterward?

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 04

State and schema

$$X_t^* = M_d(\Omega_t) \qquad \widehat{X}_t = \Sigma_d(X_t^*) \qquad G_{\Sigma,t} = \delta(X_t^*, \widehat{X}_t)$$

M_d is the domain map. Σ_d is the receiving schema: diagnosis, KPI, category, model, legal label, instrument, observable set or representation. The schema gap is the measurable distance between evidence-grounded state and what the receiver can actually recognize.

Rule: representation failure is not evidence that the unrepresented state is zero.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 05

Boundary Divergence Index

$$a_S^* = \arg\min_a J_S(a; X^*) \quad a_G^* = \arg\min_a J_G(a; X^*) \quad BDI = J_G(a_S^*) - J_G(a_G^*)$$

BDI asks whether the locally preferred action differs from the consequential-system preferred action under the same feasible action set. Non-negativity follows from the definition of the two optima. The scientific question is not whether BDI can be written, but whether the broader boundary changes decisions in consequential cases.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 06

Displacement field

$$D_a(j,k,\tau) = \mathbb{E}[U_{j,k}(t+\tau) \mid do(a)] - \mathbb{E}[U_{j,k}(t+\tau) \mid do(a_0)]$$

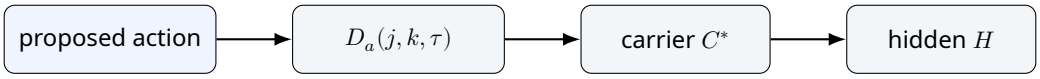
The displacement field names receiver j, native dimension k, and horizon τ. It is not a metaphorical harm score. Identification must come from an experiment, natural experiment, causal graph, difference-in-differences, instrumental variable, synthetic control, or another defensible strategy. If the effect is not identifiable, the correct output is **UNKNOWN**.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 07

LERM

LERM is the prospective and retrospective tracing operation. It asks where consequence will land, through which coupling, in which native dimension, after what delay, with what magnitude and what hidden compensator.



READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 08

IAMF-P

IAMF-P is the constructive operation. It does not merely buffer damage after the fact. It uses the carrier topology predicted by LERM to build the missing receiving capacity *before* the originating transition is released.

$$C^*, \Gamma, H \rightarrow \text{required capacity specification} \rightarrow \Delta R^*_{C^*} \rightarrow a$$

The intervention is therefore a topology edit: the same event enters a different receiving structure.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 09

Mutual Uptick

Mutual Uptick is the acceptance gate, not a slogan and not a scalar average. Every protected material carrier must clear its preregistered native-unit threshold with uncertainty accounted for, safety constraints satisfied, no new burden concentration and no hidden reserve depletion.

$$MU^{+} \iff \forall j \in G_m : \; LCB_{\alpha}(\Delta V_j) > \epsilon_j \; \wedge \; Safety \; \wedge \; RVG_j \leq 0$$

Allowed outputs remain: **NO ACTIVATION**, **UNKNOWN**, **NO FEASIBLE MU+**, or **MU+ PASS**.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 10

Reserve / Value Gap

$$\frac{db_j}{dt} = \iota_j(t) - \alpha_j(t) \qquad RVG_j = \iota_j - \alpha_j$$

A system can appear stable because a hidden reserve, caregiver, worker, ecosystem, balance sheet or future self is compensating. RVG makes that compensation visible by separating incoming burden from absorption/recovery capacity.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 11

Agency state

Choice, constraint, responsibility and recovery are kept inside one recurrent state rather than separated into four explanatory boxes.

$$\Psi_i(t) = \mathcal{G}_d(X_i^*, H_i, E_i, \mathcal{O}_i, K_i, \kappa_i) \qquad a_i \sim \pi_i(\cdot \mid \Psi_i(t))$$

Ψ contains the action-producing state: history, environment, actual option topology, information and executable capacity. IAMF-P changes that state by changing the world in which the next choice is made.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 12

Responsibility inside the same system

$$\rho_i(t) = \mathcal{R}\left(\Psi_i(t), a_i, D_{a_i}\right)$$

Responsibility is not pasted onto behavior afterward. It is a property of the same causal path that contains knowledge, foresight, control, alternatives, coercion, causal contribution and resulting displacement. Context can constrain action without automatically erasing agency; agency can remain without pretending all actors possessed the same feasible options.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 13

Consciousness coordinate

The Atlas carries consciousness inside the state rather than making every domain prove its existence from zero.

$$\chi_i(t) \in \Psi_i(t)$$

The open scientific question becomes how consciousness manifests, registers, communicates and becomes mutually legible across substrates. The schema rule is simple: low legibility is a gap in the receiver, not automatic proof of nonexistence in the source.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 14

Time and the cost of truth

A true proposition can be correct while the surrounding system is not yet able to absorb the consequences of making it operative.

$$K_T(q,t) > R_G(t) \Rightarrow \text{build receiving capacity before full transition}$$

This does not license indefinite suppression. It creates a temporal construction problem: LERM maps the cost topology, IAMF-P builds the missing capacity, the transition is phased, and MU+ is repeatedly retested through time.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 15

Coexistence closure

Stable self-existence is generally relational.

$$V_i(t+1) = f_i\Big(X_i(t), X_{N(i)}(t), E_t, t\Big)$$

Materializing a system enters it into dependency. Dependency creates consequence. Consequence creates a coexistence requirement. Adapter 120 therefore closes the preceding 119 by asking whether increasing truth, agency, capability and consciousness-legibility can become operative without forcing a dependent carrier to become the sacrificial sink.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 16

Domain compiler

$$\mathcal{C}_d : (K_R, M_d, O_d, A_d) \to (\Sigma_d, \delta_d, \Phi_d, D_d, C_d, B_d, \Delta R_d, Q_d)$$

Every adapter must emit more than prose: native equations or state relations, a schema model, measurable friction and carrier variables, an incumbent comparator, a blocker detector, a construction, a Mutual-Uptick ledger, falsifiers and a prospective test.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 17

Expanded ontology

The original ontology uses seven coordinates: substrate, scale, function, carrier, value, mode and time. The Atlas adds Ψ as the coupled agency/consciousness state where applicable without fragmenting choice, responsibility and recovery into separate worlds.

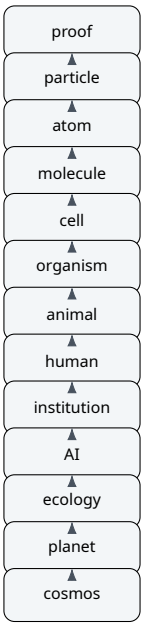
$$U^{+} = S \times L \times F \times C \times V \times M \times T \times \Psi$$

A newly discovered domain should normally require a new M_d, not a new kernel.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 18

The scale ladder



The native mechanism changes at every rung. The Atlas tests whether the relational grammar of state, transition, redistribution, reception, capacity and recurrence survives the translation.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 19

Activation outcomes

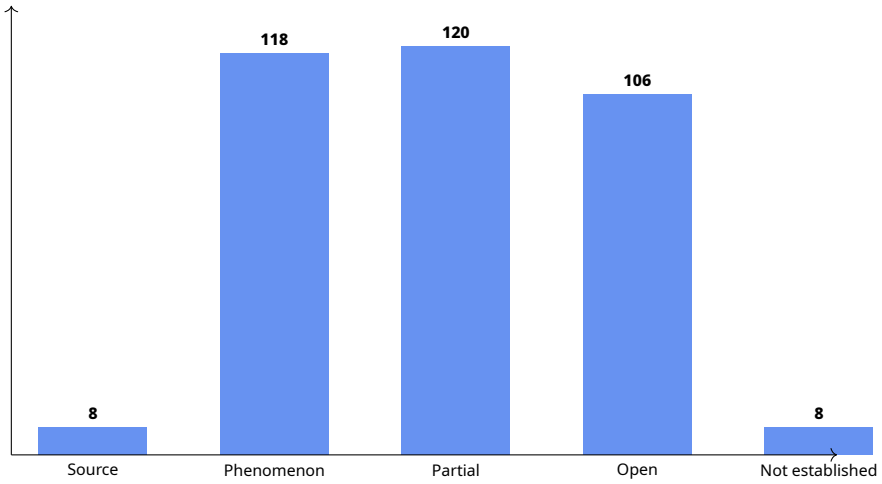
Output	Meaning
NO ACTIVATION	Local and consequential optima do not materially diverge under the preregistered boundary.
UNKNOWN	The consequential effect cannot be identified with the available evidence.
NO FEASIBLE MU+	Displacement is identified but no feasible construction clears every protected carrier.
MU+ PASS	A preregistered construction clears carrier-specific thresholds, safety, concentration and reserve gates.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 20

Validation status: 360-test register

The source register contains 360 named tests. Its current distribution is deliberately sobering: 8 source documented, 118 phenomenon documented, 120 link partial/pending, 106 kernel-test open, and 8 not established. Universal acceptance, parity, untouched holdout and independent replication remain broadly open.



READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 21

Simulation record: negatives retained

The programme retains failures. In a 250,000-case routing-only ablation, full telemetry reported 2.224283% burden reduction, LERM/IAMF-P 1.618167%, and raw LERM 1.546338%. That negative killed the lazy proposition that anything labelled LERM must win.

After changing the semantics so capacity was built at the predicted loss carrier, the exploratory corrected run reported 5.6696% for LERM+IAMF-P versus 5.5567% for full telemetry, approximately 2.03% relative advantage. Because the semantics changed after seeing the failure, this remains exploratory rather than confirmatory.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 22

Simulation record: universality is grammar, not one action

In the first 1,000,000-system experiment, a generic frozen action won only 1 of 20 domains and averaged 7.136% versus 7.567% for the strongest local-KPI strategy. In the second, changing only the objective boundary produced 7.9083% for the whole-system objective versus 7.8256% for boundary MPC, 7.506% for local KPI and 7.488% for full-telemetry next-carrier routing, while winning only about 29% of individual cases.

The sentence to remember: universality is not the same action everywhere. Universality is the same consequential grammar everywhere.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 23

Falsification standard

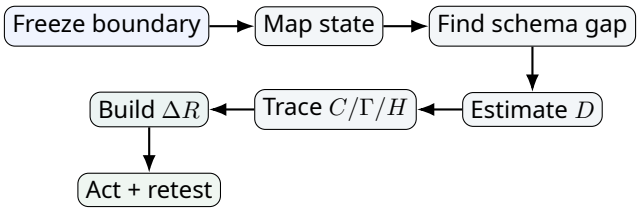
A strong test freezes the kernel, boundary, comparator, information budget and horizon before outcomes. It predicts the receiving carrier and required construction on untouched data, then reveals the outcome and compares against the strongest incumbent under parity.

The programme weakens if carrier prediction does not beat appropriate comparators, if MU+ repeatedly fails despite feasible construction, if the operator activates where no material boundary divergence exists, or if the same grammar requires hidden domain-specific repairs to survive translation.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 24

Operator workflow



The final question is always operational: what exactly should exist before the transition, who must carry it, how much capacity is sufficient, and what result would force us to revise the model?

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 25

Reading routes

Reader	Suggested route
New reader	Front matter → one familiar adapter → Adapter 120 → operator workflow.
Scientist	Kernel → domain-native plate → evidence/falsification plate → Formula Vault.
Policymaker	Boundary, carriers, time and cost-of-truth pages → governance/justice adapters → closure.
Founder/operator	BDI → blocker → capacity build → numerical ledger → run sheet.
AI researcher	Adapters 061, 070, 091, 092, 110, 120.
Philosopher	Agency, consciousness, creation/provenance, cosmology and closure.

READER MOVE Carry this concept into the first adapter you already understand.

FOUNDATION 26

Atlas map

The book contains twelve families and 120 adapters. Families 1-10 preserve the 100-domain Frontier Atlas. Families 11-12 extend it with conscious agency, responsibility, evolution, transformation, emergence and the final coexistence closure. Every adapter is a construction brief, not a declaration that its scientific test has already been won.

Family index

FAMILY 1

Human life quality

The person as a coupled biological, relational, material and temporal system.

001 Whole-person quality of life
002 Nutrition and metabolism
003 Sleep and recovery
004 Reproductive and sexual health
005 Disability and accessibility
006 Mobility and physical function
007 Family and caregiving
008 Safety and personal security
009 Housing and domestic environment
010 Human longevity and life-course planning

FAMILY 2

Psychology and meaning

Meaning, affect, identity and trust treated as consequential state, not decorative context.

011 Psychology and social legibility
012 Identity and self-model
013 Relationships and intimacy
014 Parenting and child development
015 Purpose and self-actualization
016 Existential wellbeing
017 Spiritual life
018 Religion and community institutions
019 Emotion and affect regulation
020 Trust and fidelity between people

FAMILY 3

Biomedical

Health interventions traced beyond the local target into host reserve, caregivers and future function.

021 Healthcare delivery
022 Diagnostics
023 Cancer ecology
024 Neuroscience and neurodegeneration
025 Aging biology
026 Immunology
027 Infectious disease
028 Microbiome
029 Genomics and proteomics
030 Surgery and rehabilitation

FAMILY 4

Education, justice and governance

Institutions judged by the state they create across citizens, workers, victims, actors and future administrations.

031 Early-childhood development and education
032 K-12 education
033 Higher education
034 Vocational and workforce learning
035 Scientific research
036 Justice and courts
037 Policing and public safety systems
038 Corrections, rehabilitation and reintegration
039 Public administration
040 Governance and institutional design

FAMILY 5

Culture, beauty and experience

Experience and culture translated without flattening identity, labor, safety, access or meaning.

041 Beauty and aesthetics
042 Fashion and apparel
043 Luxury goods
044 Hospitality
045 Travel and tourism
046 Art and cultural markets

047 Music and entertainment
048 Gaming and virtual worlds
049 Sports and performance
050 Experience design and events

FAMILY 6

Money, markets and organizations

Money and enterprise treated as flow systems with receiving carriers, not isolated ledgers.

051 Currency and monetary experience
052 Payments and remittances
053 Banking and liquidity
054 Credit and underwriting
055 Insurance and resilience
056 Capital markets and investing
057 Private wealth and family capital
058 Labor and talent markets
059 Organizations and enterprises
060 Entrepreneurship and venture creation

FAMILY 7

Technology and information

Digital systems evaluated by utility plus verification, provenance, agency and downstream action.

061 Artificial intelligence
062 Software systems
063 Cybersecurity
064 Data infrastructure
065 Privacy
066 Digital identity
067 Internet and communications
068 Media and information ecosystems
069 Language and translation
070 Knowledge and ontologies

FAMILY 8

Earth, infrastructure and ecology

Infrastructure and ecology modeled as coupled stocks, flows, capacities and delayed consequences.

071 Energy and power grids
072 Water and irrigation
073 Food and agriculture
074 Supply chains and logistics
075 Manufacturing
076 Waste and circular materials
077 Transportation and mobility
078 Cities and urban systems
079 Climate and disaster resilience
080 Ecology and biodiversity

FAMILY 9

Physical, microscopic and formal

The same grammar compiled into native physical, molecular, control, quantum and formal languages.

081 Cell biology
082 Molecular biology
083 Nanotechnology
084 Chemistry and reaction systems
085 Materials science
086 Classical mechanics and control
087 Thermodynamics and nonequilibrium systems
088 Electromagnetism and circuits
089 Quantum systems
090 Pure mathematics and formal systems

FAMILY 10

Frontier, illicit and cosmic

Domains where uncertainty, illegality, planetary scale or unknown substrates make guardrails decisive.

091 Statistics and causal inference
092 Logic and reasoning systems
093 Geography and territorial systems
094 Informal economy
095 Illicit and black markets
096 Orbital and space economy
097 Extraterrestrial settlement
098 Astrobiology and biosignatures
099 Planetary systems and stewardship
100 Unknown and not-yet-named realities

FAMILY 11

Conscious agency and responsibility

Constraint, choice, responsibility, consciousness and recovery represented inside one recurrent state-transition system.

101 Conscious experience and self-model
102 Choice and option topology
103 Truth, deception and disclosure
104 Responsibility and causal attribution
105 Consent, coercion and autonomy
106 Addiction, compulsion and short-horizon relief
107 Crime, violence and reconciliation
108 Animal sentience and welfare
109 Collective agency and institutional choice
110 Human-AI co-agency

FAMILY 12

Evolution, transformation and emergence

From evolution and metabolism to emergence, creation, cosmological change and final coexistence closure.

111 Evolution and natural selection
112 Reproduction, inheritance, mitosis and meiosis
113 Development and morphogenesis
114 Metabolism, diet and consumption
115 Predation, livestock and food-system transformation
116 Learning, plasticity and cultural evolution
117 Self-organization and emergence
118 Creation, provenance and dependency
119 Cosmological evolution and structure formation
120 Cross-substrate consciousness, temporal coexistence and closure

Human life quality

The person as a coupled biological, relational, material and temporal system.

ADAPTER 001 · FAMILY 1

Whole-person quality of life

Plate 1 · Native system

Current position: Constructive protocol
Family: Human life quality

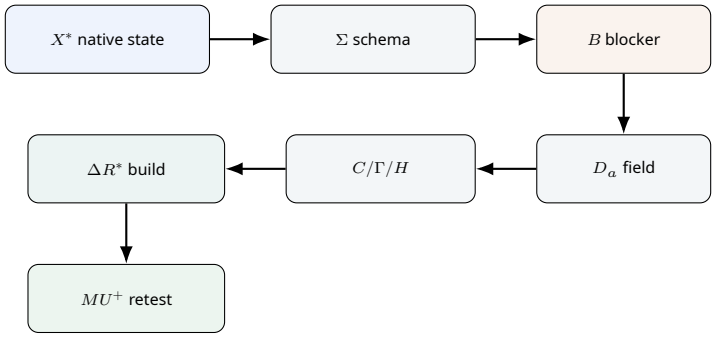
X^* **state**	Health, function, time, autonomy, relationships, safety, income, environment and future capacity
Receiving schema Σ	Single score, diagnosis, income bracket or productivity proxy
Blocker B	Improvement in one life dimension paid for by another
Carriers C	Person, household, caregivers, future self
Missing capacity ΔR	Whole-life state model plus coordinated capacity across health, time, income and environment
MU+ condition	Health, autonomy, security, time and relational capacity all improve without hidden depletion
Decisive test	Longitudinal cohort with preregistered multidimensional outcomes

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS Life-quality operating systems; preventive orchestration; integrated support infrastructure

ADAPTER 001 · FAMILY 1

Whole-person quality of life



DOMAIN INSTANTIATION

State read	Health, function, time, autonomy, relationships, safety, income, environment and future capacity
What the incumbent sees	Single score, diagnosis, income bracket or productivity proxy
Why local success can mislead	Improvement in one life dimension paid for by another
Where consequence lands	Person, household, caregivers, future self
What must exist before action	Whole-life state model plus coordinated capacity across health, time, income and environment

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 001 · FAMILY 1

Whole-person quality of life

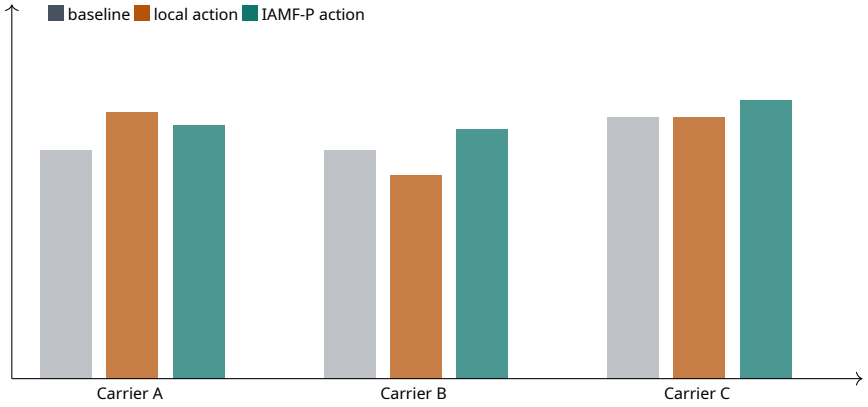
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Single score, diagnosis, income bracket or productivity proxy	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Person, household, caregivers, future self	Which receiver, pathway and hidden compensator absorb the change?
B	Improvement in one life dimension paid for by another	What prevents all protected carriers from improving together?
ΔR^*	Whole-life state model plus coordinated capacity across health, time, income and environment	What capacity must exist at the binding carrier before the transition?
MU^+	Health, autonomy, security, time and relational capacity all improve without hidden depletion	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 001 · FAMILY 1

Whole-person quality of life

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	55	64	61	Local action looks strong here.
B	55	49	60	The local action exports burden to the binding carrier.
C	63	63	67	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 001 · FAMILY 1

Whole-person quality of life

t1: Observe. Establish the domain state: Health, function, time, autonomy, relationships, safety, income, environment and future capacity.

t2: Propose. A local actor selects an action through the current schema: Single score, diagnosis, income bracket or productivity proxy.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Person, household, caregivers, future self.

t4: Construct before release. IAMF-P supplies: Whole-life state model plus coordinated capacity across health, time, income and environment.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Health, autonomy, security, time and relational capacity all improve without hidden depletion.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 001 · FAMILY 1

Whole-person quality of life

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Longitudinal cohort with preregistered multidimensional outcomes
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 001 · FAMILY 1

Whole-person quality of life

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Health, function, time, autonomy, relationships, safety, income, environment and future capacity.
3. Write the incumbent receiving schema exactly as it exists: Single score, diagnosis, income bracket or productivity proxy.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Person, household, caregivers, future self.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Whole-life state model plus coordinated capacity across health, time, income and environment.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Health, autonomy, security, time and relational capacity all improve without hidden depletion.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 002: Nutrition and metabolism · Adapter 010: Human longevity and life-course planning
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

ADAPTER 002 · FAMILY 1

Nutrition and metabolism

Plate 1 · Native system

Current position: Regulated empirical frontier
Family: Human life quality

X^* **state**	Diet, metabolic state, affordability, culture, timing, microbiome and activity
Receiving schema Σ	Calories/macros or generic diet categories
Blocker B	Biological benefit shifts cost to adherence, affordability or another metabolic pathway
Carriers C	Body, household budget, food system
Missing capacity ΔR	Adaptive nutrition and access architecture with feedback and affordability constraints
MU+ condition	Metabolic markers, adherence, affordability and quality of life improve together
Decisive test	Randomized adaptive nutrition trial with cost and adherence carriers

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS Adaptive nutrition platforms; metabolic food infrastructure

Sleep and recovery

DOMAIN INSTANTIATION

State read	Sleep architecture, circadian timing, stress, workload, environment and recovery reserve
What the incumbent sees	Hours slept or wearable score
Why local success can mislead	More sleep opportunity can displace work, care or circadian alignment
Where consequence lands	Body, cognition, household schedule
What must exist before action	Recovery controller integrating timing, environment, workload and physiology

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 003 · FAMILY 1

Sleep and recovery

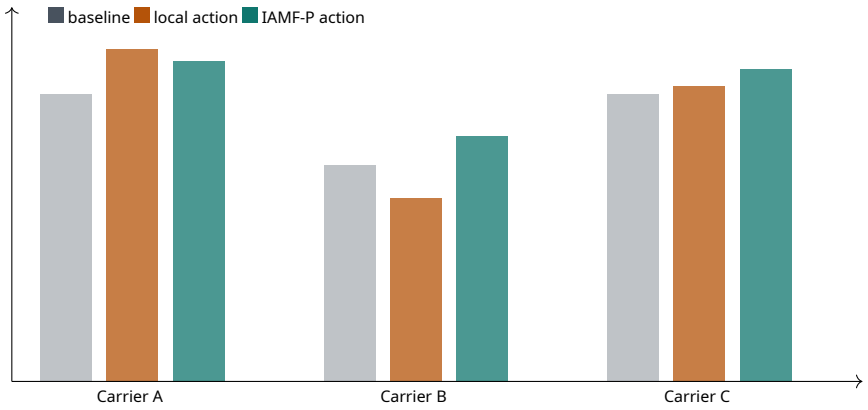
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Hours slept or wearable score	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Body, cognition, household schedule	Which receiver, pathway and hidden compensator absorb the change?
B	More sleep opportunity can displace work, care or circadian alignment	What prevents all protected carriers from improving together?
ΔR^*	Recovery controller integrating timing, environment, workload and physiology	What capacity must exist at the binding carrier before the transition?
MU^+	Recovery, cognition, safety and schedule burden improve together	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 003 · FAMILY 1

Sleep and recovery

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	69	80	77	Local action looks strong here.
B	52	44	59	The local action exports burden to the binding carrier.
C	69	71	75	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 003 · FAMILY 1

Sleep and recovery

t1: Observe. Establish the domain state: Sleep architecture, circadian timing, stress, workload, environment and recovery reserve.

t2: Propose. A local actor selects an action through the current schema: Hours slept or wearable score.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Body, cognition, household schedule.

t4: Construct before release. IAMF-P supplies: Recovery controller integrating timing, environment, workload and physiology.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Recovery, cognition, safety and schedule burden improve together.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 003 · FAMILY 1

Sleep and recovery

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Longitudinal crossover study
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 003 · FAMILY 1

Sleep and recovery

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Sleep architecture, circadian timing, stress, workload, environment and recovery reserve.
3. Write the incumbent receiving schema exactly as it exists: Hours slept or wearable score.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Body, cognition, household schedule.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Recovery controller integrating timing, environment, workload and physiology.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Recovery, cognition, safety and schedule burden improve together.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 002: Nutrition and metabolism · Adapter 004: Reproductive and sexual health · Adapter 001: Whole-person quality of life · Adapter 010: Human longevity and life-course planning
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

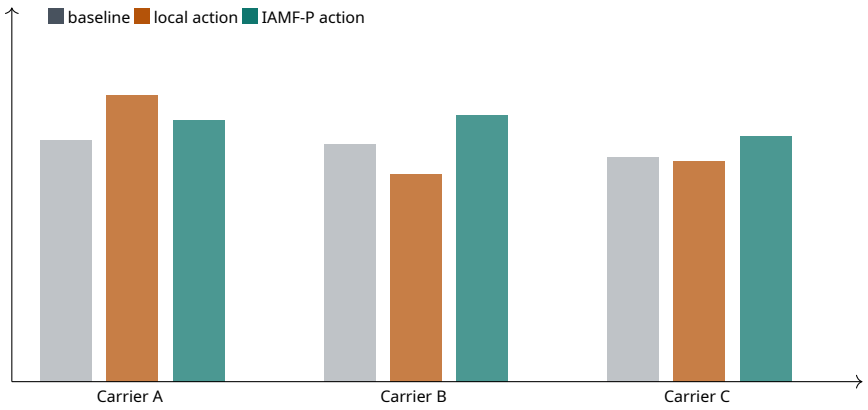
MU^+	Threat falls while freedom, privacy and response burden improve	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 008 · FAMILY 1

Safety and personal security

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	58	69	63	Local action looks strong here.
B	57	50	64	The local action exports burden to the binding carrier.
C	54	53	59	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 008 · FAMILY 1

Safety and personal security

t1: Observe. Establish the domain state: Threat exposure, environment, support, mobility and response capacity.

t2: Propose. A local actor selects an action through the current schema: Incident count or generic risk class.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Person, community, responder.

t4: Construct before release. IAMF-P supplies: Safety architecture that increases protection without reducing autonomy.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Threat falls while freedom, privacy and response burden improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 008 · FAMILY 1

Safety and personal security

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Prospective safety intervention
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 008 · FAMILY 1

Safety and personal security

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Threat exposure, environment, support, mobility and response capacity.
3. Write the incumbent receiving schema exactly as it exists: Incident count or generic risk class.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Person, community, responder.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Safety architecture that increases protection without reducing autonomy.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Threat falls while freedom, privacy and response burden improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 007: Family and caregiving · Adapter 009: Housing and domestic environment · Adapter 001: Whole-person quality of life · Adapter 010: Human longevity and life-course planning

Relationships and intimacy

t1: Observe. Establish the domain state: Needs, boundaries, consent, trust, history, resources and reciprocity.

t2: Propose. A local actor selects an action through the current schema: Relationship status or personality label.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Partners and wider support network.

t4: Construct before release. IAMF-P supplies: Reciprocal state and burden ledger plus consent architecture.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Safety, intimacy, autonomy and fairness improve together.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 013 · FAMILY 2

Relationships and intimacy

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Dyadic longitudinal study
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 013 · FAMILY 2

Relationships and intimacy

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Needs, boundaries, consent, trust, history, resources and reciprocity.
3. Write the incumbent receiving schema exactly as it exists: Relationship status or personality label.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Partners and wider support network.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Reciprocal state and burden ledger plus consent architecture.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Safety, intimacy, autonomy and fairness improve together.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 012: Identity and self-model · Adapter 014: Parenting and child development · Adapter 011: Psychology and social legibility · Adapter 020: Trust and fidelity between people
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

Neuroscience and neurodegeneration

DOMAIN INSTANTIATION

State read	Neural, glial, vascular, metabolic, network and functional state
What the incumbent sees	Single biomarker or visible function
Why local success can mislead	Compensatory recruitment hides reserve depletion
Where consequence lands	Neural networks, metabolism, caregiver
What must exist before action	Multimodal state estimator + restorative capacity controller

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 024 · FAMILY 3

Neuroscience and neurodegeneration

Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Single biomarker or visible function	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Neural networks, metabolism, caregiver	Which receiver, pathway and hidden compensator absorb the change?
B	Compensatory recruitment hides reserve depletion	What prevents all protected carriers from improving together?
ΔR^*	Multimodal state estimator + restorative capacity controller	What capacity must exist at the binding carrier before the transition?
MU^+	Function and reserve rise while damage and compensation fall	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 029 · FAMILY 3

Genomics and proteomics

t1: Observe. Establish the domain state: Variants, expression, proteins, pathways, context and phenotype.

t2: Propose. A local actor selects an action through the current schema: Single marker/pathogenicity label.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Cells, tissues, patient.

t4: Construct before release. IAMF-P supplies: Multi-omic causal state architecture.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Target outcome improves without network collateral burden.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 029 · FAMILY 3

Genomics and proteomics

Current status	Strong structural fit
Source reading	The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.
Decisive next design	Prospective multi-omic validation
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 029 · FAMILY 3

Genomics and proteomics

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Variants, expression, proteins, pathways, context and phenotype.
3. Write the incumbent receiving schema exactly as it exists: Single marker/pathogenicity label.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Cells, tissues, patient.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Multi-omic causal state architecture.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Target outcome improves without network collateral burden.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 034 · FAMILY 4 Vocational and workforce learning

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Skills, task demand, wages, mobility and employer needs.
3. Write the incumbent receiving schema exactly as it exists: Course completion certificate.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Worker, employer, training provider.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Skill-to-task provenance and placement architecture.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Skill, earnings, job quality and employer performance improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 033: Higher education · Adapter 035: Scientific research · Adapter 031: Early-childhood development and education · Adapter 040: Governance and institutional design
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

Why local success can mislead	Visitor gain shifts congestion, environmental or resident burden
Where consequence lands	Traveler, worker, resident, ecosystem
What must exist before action	Consequential itinerary/capacity controller

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 045 · FAMILY 5

Travel and tourism

Plate 3 · Native-to-universal language

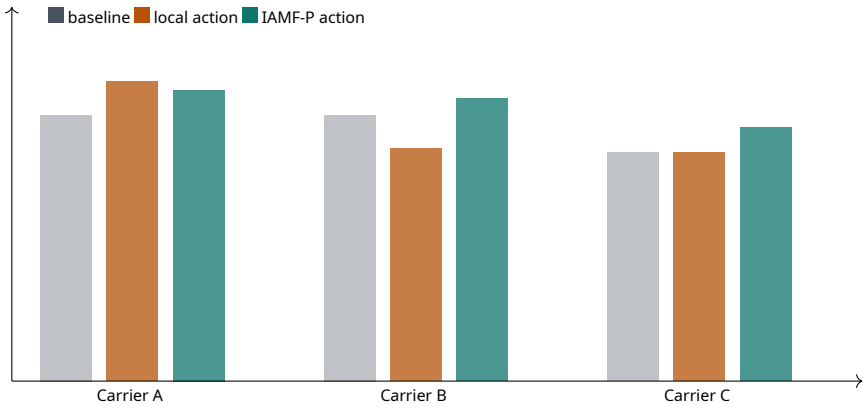
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Itinerary/booking schema	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Traveler, worker, resident, ecosystem	Which receiver, pathway and hidden compensator absorb the change?
B	Visitor gain shifts congestion, environmental or resident burden	What prevents all protected carriers from improving together?
ΔR^*	Consequential itinerary/capacity controller	What capacity must exist at the binding carrier before the transition?
MU^+	Experience, resident value, worker conditions and environmental load improve	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 045 · FAMILY 5

Travel and tourism

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	64	72	70	Local action looks strong here.
B	64	56	68	The local action exports burden to the binding carrier.
C	55	55	61	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 045 · FAMILY 5

Travel and tourism

t1: Observe. Establish the domain state: Mobility, cost, safety, experience, local capacity and environment.

t2: Propose. A local actor selects an action through the current schema: Itinerary/booking schema.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Traveler, worker, resident, ecosystem.

t4: Construct before release. IAMF-P supplies: Consequential itinerary/capacity controller.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Experience, resident value, worker conditions and environmental load improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 045 · FAMILY 5

Travel and tourism

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Destination pilot
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 045 · FAMILY 5

Travel and tourism

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Mobility, cost, safety, experience, local capacity and environment.
3. Write the incumbent receiving schema exactly as it exists: Itinerary/booking schema.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Traveler, worker, resident, ecosystem.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Consequential itinerary/capacity controller.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Experience, resident value, worker conditions and environmental load improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	53	61	60	Local action looks strong here.
B	44	37	48	The local action exports burden to the binding carrier.
C	60	61	65	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 050 · FAMILY 5

Experience design and events

t1: Observe. Establish the domain state: Attention, emotion, logistics, accessibility, staff load and community impact.

t2: Propose. A local actor selects an action through the current schema: Attendance/NPS/ticket revenue.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Guests, staff, locality.

t4: Construct before release. IAMF-P supplies: End-to-end experience-state orchestration.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Experience, access, worker load and local impact improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 050 · FAMILY 5

Experience design and events

Current status	Constructive protocol
Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Event A/B study
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 050 · FAMILY 5

Experience design and events

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Attention, emotion, logistics, accessibility, staff load and community impact.
3. Write the incumbent receiving schema exactly as it exists: Attendance/NPS/ticket revenue.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Guests, staff, locality.
6. Specify the smallest feasible capacity build capable of resolving the blocker: End-to-end experience-state orchestration.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Experience, access, worker load and local impact improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 049: Sports and performance · Adapter 051: Currency and monetary experience · Adapter 041: Beauty and aesthetics
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

Source reading	The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.
Decisive next design	Pilot product evaluation
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 055 · FAMILY 6

Insurance and resilience

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Hazard, exposure, prevention, coverage, recovery and incentives.
3. Write the incumbent receiving schema exactly as it exists: Loss probability/policy class.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Policyholder, insurer, community.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Prevention + resilience + coverage architecture.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Losses, recovery time, affordability and insurer viability improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 054: Credit and underwriting · Adapter 056: Capital markets and investing · Adapter 051: Currency and monetary experience · Adapter 060: Entrepreneurship and venture creation
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

What the incumbent sees	Return/risk factor set
Why local success can mislead	Portfolio gain can externalize future or nonmarket cost
Where consequence lands	Investor, firm, workers, public, environment
What must exist before action	Consequential asset ledger with carrier constraints

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 056 · FAMILY 6

Capital markets and investing

Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Return/risk factor set	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Investor, firm, workers, public, environment	Which receiver, pathway and hidden compensator absorb the change?
B	Portfolio gain can externalize future or non-market cost	What prevents all protected carriers from improving together?
ΔR^*	Consequential asset ledger with carrier constraints	What capacity must exist at the binding carrier before the transition?
MU^+	Risk-adjusted return and protected carrier outcomes improve	What carrier-specific result counts as success rather than average improvement?

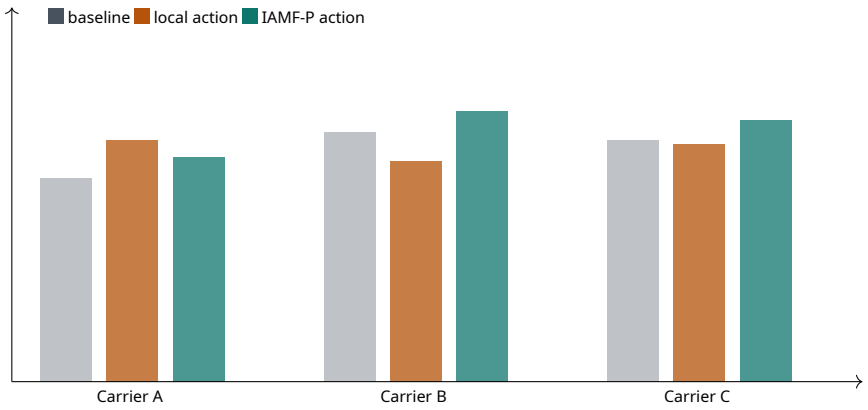
Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 056 · FAMILY 6

Capital markets and investing

Plate 4 · Numerical play-through

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	49	58	54	Local action looks strong here.
B	60	53	65	The local action exports burden to the binding carrier.
C	58	57	63	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 056 · FAMILY 6

Capital markets and investing

t1: Observe. Establish the domain state: Price, cashflow, externalities, network risk and long-horizon value.

t2: Propose. A local actor selects an action through the current schema: Return/risk factor set.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Investor, firm, workers, public, environment.

t4: Construct before release. IAMF-P supplies: Consequential asset ledger with carrier constraints.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Risk-adjusted return and protected carrier outcomes improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

8. Accept only if: Customer and surrounding carriers gain while venture captures part of released value.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 059: Organizations and enterprises · Adapter 061: Artificial intelligence · Adapter 051: Currency and monetary experience
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

FAMILY 7 OF 12

Technology and information

Digital systems evaluated by utility plus verification, provenance, agency and downstream action.

Adapters 061-070

ADAPTER 061 · FAMILY 7

Artificial intelligence

Plate 1 · Native system

Current position: Strong constructive fit
Family: Technology and information

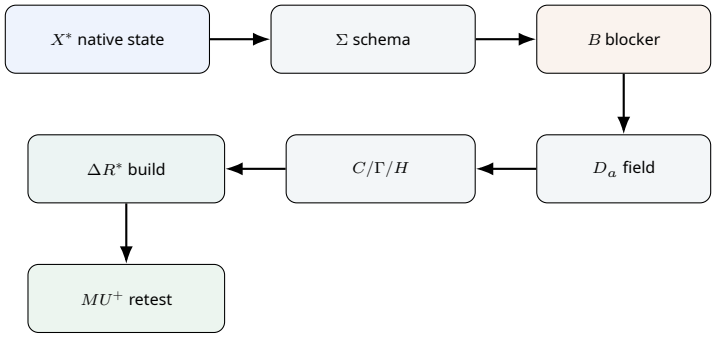
X^* **state**	Model state, source reality, user intent, provenance, uncertainty and downstream action
Receiving schema Σ	Prompt/context window/model output
Blocker B	Model utility shifts verification and error burden to humans
Carriers C	User, verifier, downstream system, compute
Missing capacity ΔR	Persistent schema/provenance layer + self-audit and escalation
MU+ condition	Utility, correctness, verification load and resource efficiency improve
Decisive test	Sealed cross-model benchmark

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS AI reliability and provenance infrastructure

ADAPTER 061 · FAMILY 7

Artificial intelligence



DOMAIN INSTANTIATION

State read	Model state, source reality, user intent, provenance, uncertainty and downstream action
What the incumbent sees	Prompt/context window/model output
Why local success can mislead	Model utility shifts verification and error burden to humans
Where consequence lands	User, verifier, downstream system, compute
What must exist before action	Persistent schema/provenance layer + self-audit and escalation

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 061 · FAMILY 7

Artificial intelligence

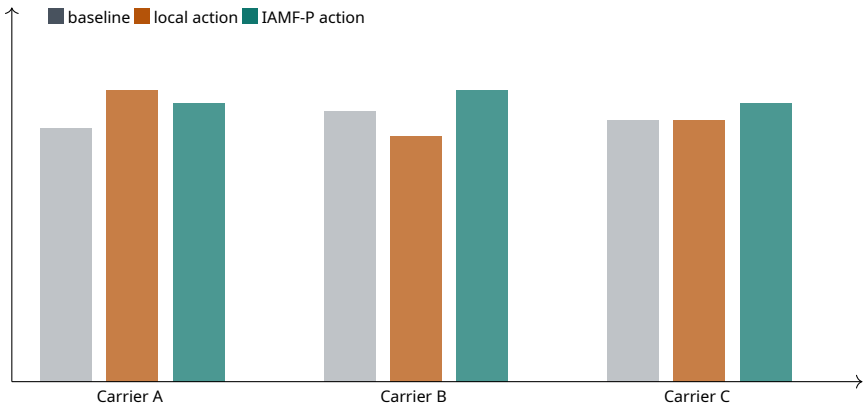
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Prompt/context window/model output	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	User, verifier, downstream system, compute	Which receiver, pathway and hidden compensator absorb the change?
B	Model utility shifts verification and error burden to humans	What prevents all protected carriers from improving together?
ΔR^*	Persistent schema/provenance layer + self-audit and escalation	What capacity must exist at the binding carrier before the transition?
MU^+	Utility, correctness, verification load and resource efficiency improve	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 061 · FAMILY 7

Artificial intelligence

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	61	70	67	Local action looks strong here.
B	65	59	70	The local action exports burden to the binding carrier.
C	63	63	67	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 061 · FAMILY 7 **Artificial intelligence** Plate 5 · Time and play-by-play

t1: Observe. Establish the domain state: Model state, source reality, user intent, provenance, uncertainty and downstream action.

t2: Propose. A local actor selects an action through the current schema: Prompt/context window/model output.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: User, verifier, downstream system, compute.

t4: Construct before release. IAMF-P supplies: Persistent schema/provenance layer + self-audit and escalation.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Utility, correctness, verification load and resource efficiency improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 061 · FAMILY 7

Artificial intelligence

Current status	Strong constructive fit
Source reading	A construction is both specifiable and testable now, often with existing digital telemetry.
Decisive next design	Sealed cross-model benchmark
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 061 · FAMILY 7 **Artificial intelligence** Plate 7 · What to do next

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Model state, source reality, user intent, provenance, uncertainty and downstream action.
3. Write the incumbent receiving schema exactly as it exists: Prompt/context window/model output.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: User, verifier, downstream system, compute.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Persistent schema/provenance layer + self-audit and escalation.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Utility, correctness, verification load and resource efficiency improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 060: Entrepreneurship and venture creation · Adapter 062: Software systems · Adapter 070: Knowledge and ontologies

DOMAIN INSTANTIATION

State read	Attributes, credentials, context, revocation, privacy and trust
What the incumbent sees	Single identifier/account
Why local success can mislead	Verification success creates overcollection or exclusion
Where consequence lands	Person, verifier, issuer
What must exist before action	Selective-verification credential graph

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 066 · FAMILY 7

Digital identity

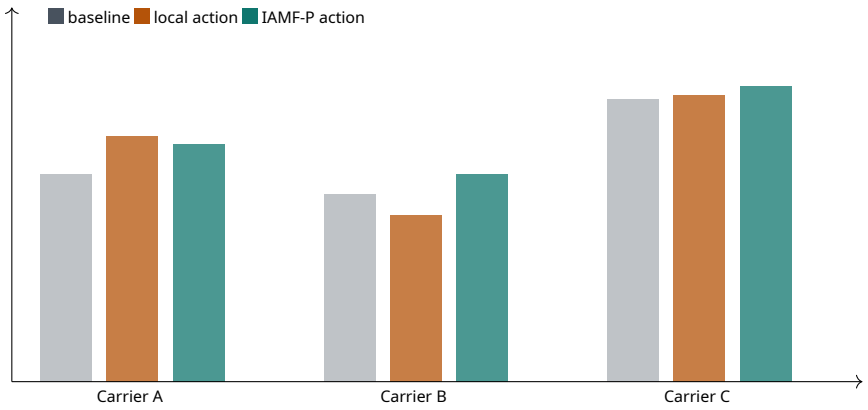
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Single identifier/account	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Person, verifier, issuer	Which receiver, pathway and hidden compensator absorb the change?
B	Verification success creates overcollection or exclusion	What prevents all protected carriers from improving together?
ΔR^*	Selective-verification credential graph	What capacity must exist at the binding carrier before the transition?
MU^+	Verification, privacy, portability and access improve	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 066 · FAMILY 7

Digital identity

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	50	59	57	Local action looks strong here.
B	45	40	50	The local action exports burden to the binding carrier.
C	68	69	71	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 071 · FAMILY 8

Energy and power grids

t1: Observe. Establish the domain state: Generation, load, storage, network constraints, prices and reliability.

t2: Propose. A local actor selects an action through the current schema: Local device efficiency or node KPI.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Grid nodes, customers, storage, environment.

t4: Construct before release. IAMF-P supplies: Consequential grid controller + capacity placement.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Reliability, affordability, emissions and congestion improve.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 071 · FAMILY 8

Energy and power grids

Current status	Strong structural fit
Source reading	The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.
Decisive next design	Grid simulation + pilot
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 071 · FAMILY 8

Energy and power grids

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Generation, load, storage, network constraints, prices and reliability.
3. Write the incumbent receiving schema exactly as it exists: Local device efficiency or node KPI.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Grid nodes, customers, storage, environment.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Consequential grid controller + capacity placement.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Reliability, affordability, emissions and congestion improve.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

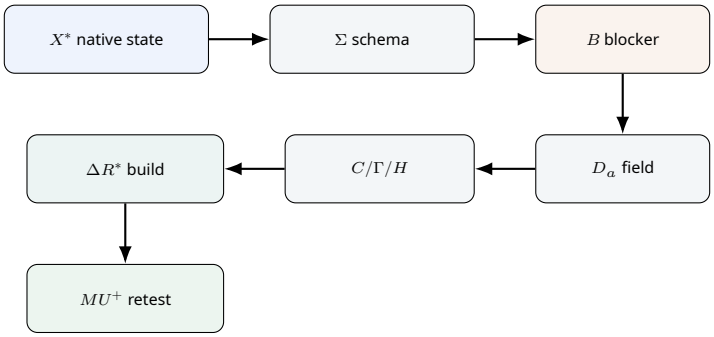
X^* **state**	Molecules, conformations, binding networks, concentrations and kinetics
Receiving schema Σ	Single interaction/target
Blocker B	Target binding shifts network or toxicity burden
Carriers C	Molecules, pathways, host system
Missing capacity ΔR	Reaction/network state model + off-target carrier control
MU+ condition	Desired molecular effect rises while off-target burden falls
Decisive test	Bench experiments

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS Molecular design infrastructure

ADAPTER 082 · FAMILY 9

Molecular biology



DOMAIN INSTANTIATION

State read	Molecules, conformations, binding networks, concentrations and kinetics
What the incumbent sees	Single interaction/target
Why local success can mislead	Target binding shifts network or toxicity burden
Where consequence lands	Molecules, pathways, host system
What must exist before action	Reaction/network state model + off-target carrier control

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 082 · FAMILY 9

Molecular biology

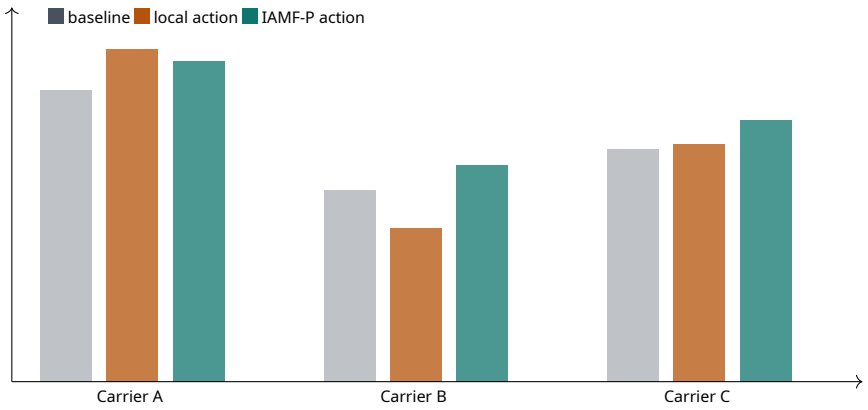
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Single interaction/target	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Molecules, pathways, host system	Which receiver, pathway and hidden compensator absorb the change?
B	Target binding shifts network or toxicity burden	What prevents all protected carriers from improving together?
ΔR^*	Reaction/network state model + off-target carrier control	What capacity must exist at the binding carrier before the transition?
MU^+	Desired molecular effect rises while off-target burden falls	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 082 · FAMILY 9

Molecular biology

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	70	80	77	Local action looks strong here.
B	46	37	52	The local action exports burden to the binding carrier.
C	56	57	63	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 082 · FAMILY 9

Molecular biology

t1: Observe. Establish the domain state: Molecules, conformations, binding networks, concentrations and kinetics.

t2: Propose. A local actor selects an action through the current schema: Single interaction/target.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Molecules, pathways, host system.

t4: Construct before release. IAMF-P supplies: Reaction/network state model + off-target carrier control.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Desired molecular effect rises while off-target burden falls.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 082 · FAMILY 9

Molecular biology

Current status	Regulated empirical frontier
Source reading	Evidence must come from regulated trials or audits; this entry is research architecture only.
Decisive next design	Bench experiments
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 102 · FAMILY 11

Choice and option topology

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Actual options, perceived options, cost, risk, time, capacity, knowledge, coercion and expected consequence.
3. Write the incumbent receiving schema exactly as it exists: Binary free-choice / no-choice label.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Chooser, affected people, institutions and future option set.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Feasible-option map plus prebuilt low-friction lawful/prosocial pathways.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Agency expands while downstream harm and coercive friction fall.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 101: Conscious experience and self-model · Adapter 103: Truth, deception and disclosure · Adapter 110: Human-AI co-agency
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

ADAPTER 103 · FAMILY 11

Truth, deception and disclosure

Plate 1 · Native system

Current position: Constructive protocol
Family: Conscious agency and responsibility

X^* **state**	Belief, evidence, incentives, threat, reputation, disclosure cost, dependency and repair capacity
Receiving schema Σ	Truth/lie binary detached from consequence topology
Blocker B	Truth creates concentrated cost or deception remains locally profitable because receiving capacity is absent
Carriers C	Speaker, listener, harmed parties, institutions and future trust network
Missing capacity ΔR	Verification, safe disclosure, correction, restitution and transition capacity
MU+ condition	Fidelity rises while truthful disclosure no longer requires avoidable destruction of material carriers
Decisive test	Sealed truth-cost / disclosure study

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS Truth-provenance and disclosure infrastructure

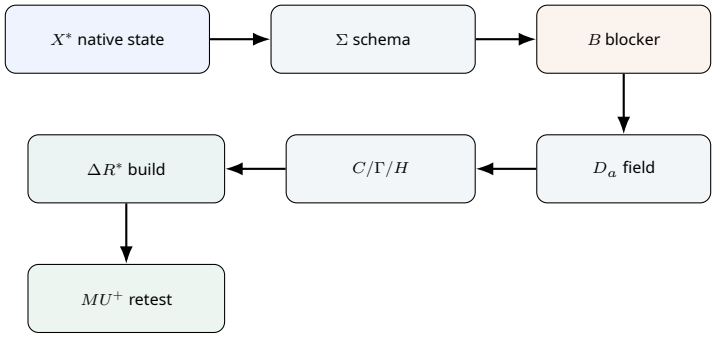
Truth, deception and disclosure



DOMAIN INSTANTIATION

State read	Belief, evidence, incentives, threat, reputation, disclosure cost, dependency and repair capacity
What the incumbent sees	Truth/lie binary detached from consequence topology
Why local success can mislead	Truth creates concentrated cost or deception remains locally profitable because receiving capacity is absent
Where consequence lands	Speaker, listener, harmed parties, institutions and future trust network
What must exist before action	Verification, safe disclosure, correction, restitution and transition capacity

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 103 · FAMILY 11

Truth, deception and disclosure

Plate 3 · Native-to-universal language

Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Truth/lie binary detached from consequence topology	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Speaker, listener, harmed parties, institutions and future trust network	Which receiver, pathway and hidden compensator absorb the change?
B	Truth creates concentrated cost or deception remains locally profitable because receiving capacity is absent	What prevents all protected carriers from improving together?
ΔR^*	Verification, safe disclosure, correction, restitution and transition capacity	What capacity must exist at the binding carrier before the transition?
MU^+	Fidelity rises while truthful disclosure no longer requires avoidable destruction of material carriers	What carrier-specific result counts as success rather than average improvement?

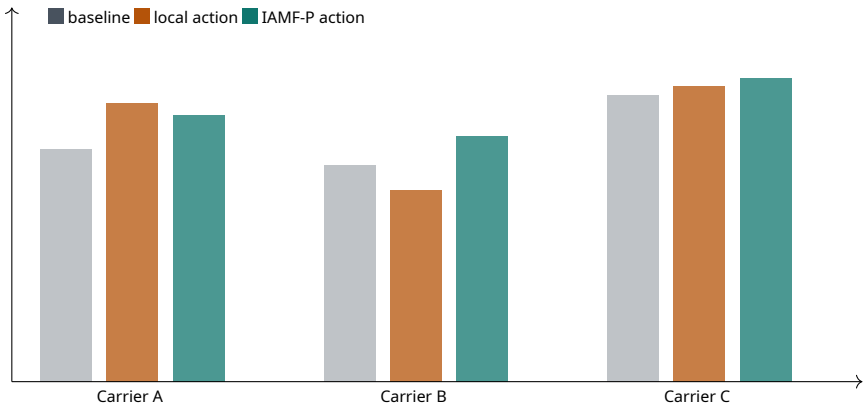
Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 103 · FAMILY 11

Truth, deception and disclosure

Plate 4 · Numerical play-through

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	56	67	64	Local action looks strong here.
B	52	46	59	The local action exports burden to the binding carrier.
C	69	71	73	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 103 · FAMILY 11

Truth, deception and disclosure

t1: Observe. Establish the domain state: Belief, evidence, incentives, threat, reputation, disclosure cost, dependency and repair capacity.

t2: Propose. A local actor selects an action through the current schema: Truth/lie binary detached from consequence topology.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Speaker, listener, harmed parties, institutions and future trust network.

t4: Construct before release. IAMF-P supplies: Verification, safe disclosure, correction, restitution and transition capacity.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Fidelity rises while truthful disclosure no longer requires avoidable destruction of material carriers.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

A	61	71	69	Local action looks strong here.
B	46	36	52	The local action exports burden to the binding carrier.
C	61	63	69	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 107 · FAMILY 11

Crime, violence and reconciliation

t1: Observe. Establish the domain state: Actor state, victim state, opportunity, motives, option topology, weapons/access, social environment and foreseeable harm.

t2: Propose. A local actor selects an action through the current schema: Offense label or actor-only risk score.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Victims, actor, families, community, institutions and future potential victims.

t4: Construct before release. IAMF-P supplies: Prevention, containment where needed, restitution, rehabilitation and reintegration capacity in one ledger.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Victim safety, accountability, recurrence, repair and future lawful agency improve together.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 107 · FAMILY 11

Crime, violence and reconciliation

Current status	High-stakes protocol
Source reading	2026 Universal Reality Atlas expansion; requires domain-native validation.
Decisive next design	Longitudinal controlled justice-program evaluation
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 107 · FAMILY 11

Crime, violence and reconciliation

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Actor state, victim state, opportunity, motives, option topology, weapons/access, social environment and foreseeable harm.
3. Write the incumbent receiving schema exactly as it exists: Offense label or actor-only risk score.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Victims, actor, families, community, institutions and future potential victims.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Prevention, containment where needed, restitution, rehabilitation and reintegration capacity in one ledger.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Victim safety, accountability, recurrence, repair and future lawful agency improve together.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 106: Addiction, compulsion and short-horizon relief · Adapter 108: Animal sentience and welfare · Adapter 101: Conscious experience and self-model · Adapter 110: Human-AI co-agency

Reproduction, inheritance, mitosis and meiosis

DOMAIN INSTANTIATION

State read	Chromosomes, cell-cycle state, replication, recombination, segregation, repair and developmental context
What the incumbent sees	Outcome-only birth/division count
Why local success can mislead	Propagation success hides fidelity loss, developmental burden or downstream instability
Where consequence lands	Parent cell/organism, daughter cells, gametes, offspring and lineage
What must exist before action	Checkpoint, repair, redundancy and developmental-support capacity

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 112 · FAMILY 12

Reproduction, inheritance, mitosis and meiosis

Plate 3 · Native-to-universal language

Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Outcome-only birth/division count	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Parent cell/organism, daughter cells, gametes, offspring and lineage	Which receiver, pathway and hidden compensator absorb the change?
B	Propagation success hides fidelity loss, developmental burden or downstream instability	What prevents all protected carriers from improving together?
ΔR^*	Checkpoint, repair, redundancy and developmental-support capacity	What capacity must exist at the binding carrier before the transition?
MU^+	Propagation remains viable while fidelity, diversity and downstream function stay within safe bounds	What carrier-specific result counts as success rather than average improvement?

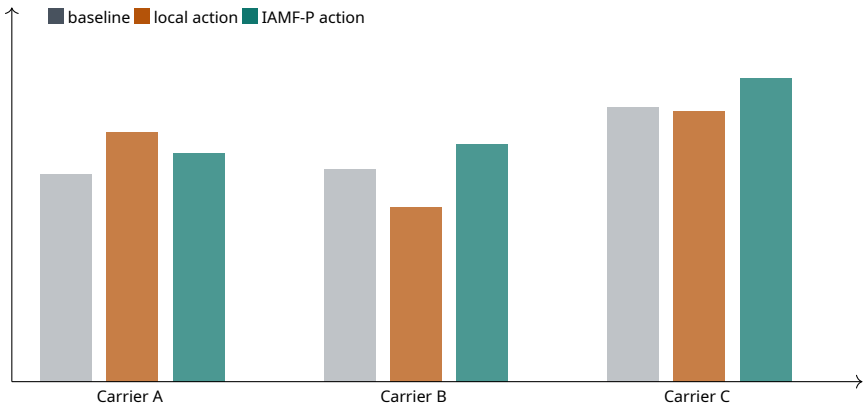
Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 112 · FAMILY 12

Reproduction, inheritance, mitosis and meiosis

Plate 4 · Numerical play-through

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	50	60	55	Local action looks strong here.
B	51	42	57	The local action exports burden to the binding carrier.
C	66	65	73	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 112 · FAMILY 12

Reproduction, inheritance, mitosis and meiosis

t1: Observe. Establish the domain state: Chromosomes, cell-cycle state, replication, recombination, segregation, repair and developmental context.

t2: Propose. A local actor selects an action through the current schema: Outcome-only birth/division count.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Parent cell/organism, daughter cells, gametes, offspring and lineage.

t4: Construct before release. IAMF-P supplies: Checkpoint, repair, redundancy and developmental-support capacity.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Propagation remains viable while fidelity, diversity and downstream function stay within safe bounds.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 112 · FAMILY 12

Reproduction, inheritance, mitosis and meiosis

Current status	Strong structural translation
Source reading	2026 Universal Reality Atlas expansion; requires domain-native validation.
Decisive next design	Lineage-resolved perturbation study
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

ADAPTER 112 · FAMILY 12

Reproduction, inheritance, mitosis and meiosis

1. Freeze the consequential boundary, horizon, protected carriers and comparator before seeing outcomes.
2. Build the native state model from: Chromosomes, cell-cycle state, replication, recombination, segregation, repair and developmental context.
3. Write the incumbent receiving schema exactly as it exists: Outcome-only birth/division count.
4. Estimate whether the local and consequential optima diverge. If not, return NO ACTIVATION.
5. Identify D_a, then the receiving carrier/path/hidden compensation in: Parent cell/organism, daughter cells, gametes, offspring and lineage.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Checkpoint, repair, redundancy and developmental-support capacity.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Propagation remains viable while fidelity, diversity and downstream function stay within safe bounds.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 111: Evolution and natural selection · Adapter 113: Development and morphogenesis · Adapter 120: Cross-substrate consciousness, temporal coexistence and closure
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

ADAPTER 113 · FAMILY 12

Development and morphogenesis

Plate 1 · Native system

Current position: Regulated empirical frontier
Family: Evolution, transformation and emergence

X^* **state**	Gene regulation, gradients, cell fate, tissue geometry, signaling, mechanics, resources and developmental time
Receiving schema Σ	Single marker or endpoint morphology
Blocker B	Correcting one developmental feature displaces stress into another tissue, stage or regulatory pathway
Carriers C	Cells, tissues, organs, organism and developmental future state
Missing capacity ΔR	Stage-aware multi-pathway support, repair and resource architecture
MU+ condition	Functional development improves without compensatory developmental injury
Decisive test	Longitudinal developmental perturbation study

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

5. Identify D_a, then the receiving carrier/path/hidden compensation in: Learner, teachers, peers, institutions, future self and cultural network.
6. Specify the smallest feasible capacity build capable of resolving the blocker: Feedback, practice, memory, rest, social scaffolding and plural knowledge capacity.
7. Run the transition under parity and retain negatives, UNKNOWN and NO FEASIBLE MU+ outcomes.
8. Accept only if: Capability, transfer, wellbeing and future learning capacity improve together.
9. Publish provenance: data, boundary, equations, uncertainty, failed alternatives and post-state.

Cross-references. Adapter 115: Predation, livestock and food-system transformation · Adapter 117: Self-organization and emergence · Adapter 111: Evolution and natural selection · Adapter 120: Cross-substrate consciousness, temporal coexistence and closure
Operator output: a dated boundary memo, carrier register, causal estimand, capacity specification, MU+ gate sheet and next-state update.

END OF ADAPTER The next adapter changes the substrate or scale, not the frozen consequential questions.

ADAPTER 117 · FAMILY 12

Self-organization and emergence

Plate 1 · Native system

Current position: Formal / empirical frontier
Family: Evolution, transformation and emergence

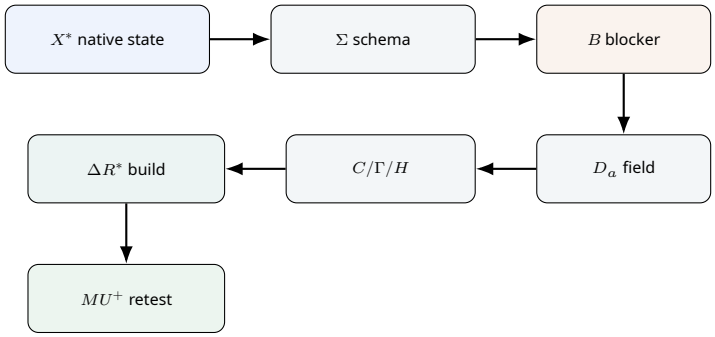
X^* **state**	Local interactions, gradients, constraints, feedback, network topology, resource flows and macrostate
Receiving schema Σ	Macro outcome without micro-carrier ledger
Blocker B	Emergent order appears beneficial while unstable local compensation accumulates
Carriers C	Components, neighborhoods, emergent structure and external environment
Missing capacity ΔR	Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity
MU+ condition	Emergent order remains viable while local stress and hidden compensation decline
Decisive test	Multi-scale simulation plus physical/biological holdout

Reader lens. The native system is not replaced by K_R terminology. The adapter asks whether its own variables can be mapped into the same consequential questions without losing the domain's mechanism.

FRONTIER / APPLICATION CLASS Emergent-system observability and control

ADAPTER 117 · FAMILY 12

Self-organization and emergence



DOMAIN INSTANTIATION

State read	Local interactions, gradients, constraints, feedback, network topology, resource flows and macrostate
What the incumbent sees	Macro outcome without micro-carrier ledger
Why local success can mislead	Emergent order appears beneficial while unstable local compensation accumulates
Where consequence lands	Components, neighborhoods, emergent structure and external environment
What must exist before action	Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity

Translation rule. Keep the arrows; replace only the nouns, units, dynamics and feasible actions through M_d. If the relation itself must be changed to make the adapter fit, that is evidence against universality rather than a reason to quietly rewrite the kernel.

ADAPTER 117 · FAMILY 12

Self-organization and emergence

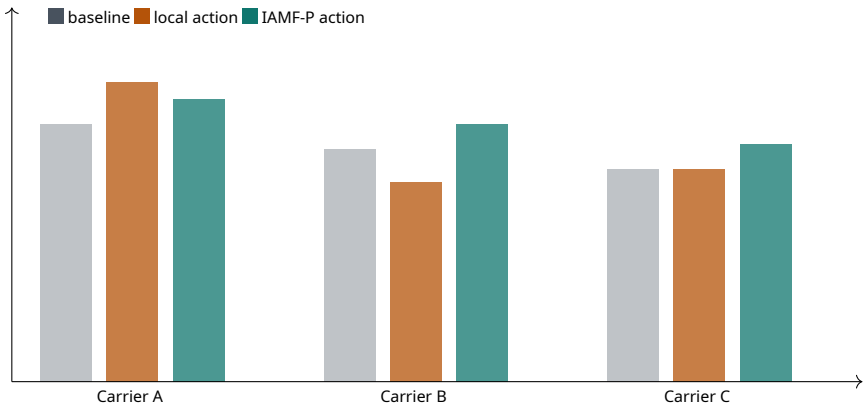
Universal term	Native reading	Operational question
X^*	evidence-grounded domain state	What variables must be known before a consequential claim is allowed?
Σ	Macro outcome without micro-carrier ledger	What does the current receiver compress, omit or misclassify?
BDI	local vs consequential objective	Would the preferred action change if the full material boundary were used?
D_a	domain-native displacement	Who changes, in which unit, and after what delay relative to comparator a_0?
$C/\Gamma/H$	Components, neighborhoods, emergent structure and external environment	Which receiver, pathway and hidden compensator absorb the change?
B	Emergent order appears beneficial while unstable local compensation accumulates	What prevents all protected carriers from improving together?
ΔR^*	Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity	What capacity must exist at the binding carrier before the transition?
MU^+	Emergent order remains viable while local stress and hidden compensation decline	What carrier-specific result counts as success rather than average improvement?

Non-metaphor test. Every row should eventually acquire native observables, units, uncertainty and an identification strategy. A poetic resemblance is not enough.

ADAPTER 117 · FAMILY 12

Self-organization and emergence

Illustrative numbers only. These values are a teaching instrument, not empirical measurements for this domain. They demonstrate why carrier-level accounting differs from a local average.



Carrier	Baseline	Local action	IAMF-P action	Interpretation
A	62	72	68	Local action looks strong here.
B	56	48	62	The local action exports burden to the binding carrier.
C	51	51	57	Secondary carrier reveals delayed/systemic effect.

The local action's mean can look acceptable while one protected carrier deteriorates. MU+ therefore evaluates each protected carrier separately; it does not let Carrier A's gain purchase Carrier B's loss.

ADAPTER 117 · FAMILY 12

Self-organization and emergence

t1: Observe. Establish the domain state: Local interactions, gradients, constraints, feedback, network topology, resource flows and macrostate.

t2: Propose. A local actor selects an action through the current schema: Macro outcome without micro-carrier ledger.

t3: Predict. LERM estimates the displacement field and identifies the consequential receivers: Components, neighborhoods, emergent structure and external environment.

t4: Construct before release. IAMF-P supplies: Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity.

t5: Transition. The action/event now enters a prepared receiving topology rather than the original one.

t6: Retest. Measure whether Emergent order remains viable while local stress and hidden compensation decline.

t7: Recur. Feed the observed post-state back into Ω_{t+1}; newly visible burden becomes part of the next state rather than being discarded.

Time rule. A consequence that has not materialized yet is not zero. It remains a horizon-specific prediction with uncertainty until the horizon closes.

ADAPTER 117 · FAMILY 12

Self-organization and emergence

Current status	Formal / empirical frontier
Source reading	2026 Universal Reality Atlas expansion; requires domain-native validation.
Decisive next design	Multi-scale simulation plus physical/biological holdout
Strong falsifier	Frozen K_R carrier prediction fails against the best incumbent under information and budget parity; or the predicted construction repeatedly fails the preregistered MU+ carrier gates.
Weak evidence	Retrospective story-fit, hand-picked success cases, altered semantics after outcome, or a domain translation with no native observables.
Strong evidence	Preregistered boundary, causal identification, sealed carrier prediction, prospective/untouched holdout, parity benchmark and independent replication.

Status discipline. A clean adapter is a hypothesis generator. It becomes an empirical result only when the native domain earns its own measurement, identification and prospective test.

KILL QUESTION What observation would force this adapter to be revised rather than explained away?

FORMULA 09

Responsibility field

$$\rho_i(t) = \mathcal{R}(\Psi_i(t), a_i, D_{a_i})$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 10

Expanded ontology

$$U^{+} = S \times L \times F \times C \times V \times M \times T \times \Psi$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 11

Domain compiler

$$\mathcal{C}_d : (K_R, M_d, O_d, A_d) \to (\Sigma_d, \delta_d, \Phi_d, D_d, C_d, B_d, \Delta R_d, Q_d)$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 12

Mutual Uptick

$$MU^{+} \iff \forall j \in G_m : \; LCB_{\alpha}(\Delta V_j) > \epsilon_j \wedge Safety \wedge RVG_j \leq 0$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 13

Truth-cost condition

$$K_T(q,t) > R_G(t) \Rightarrow \text{build capacity before full transition}$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 14

Relational viability

$$V_i(t+1) = f_i(X_i(t), X_{N(i)}(t), E_t, t)$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

FORMULA 15

Closure operator

$$A_{120} = \mathcal{C}_{\chi}(A_1, A_2, \dots, A_{119}, t)$$

Use this equation only after the domain map defines native variables, units, observables and uncertainty. The Formula Vault is a grammar reference, not permission to replace domain science with notation.

OPERATIONAL QUESTION What measurement would make each symbol non-metaphorical in this domain?

Evidence Ledger

PROGRAMME STATUS

What is established, supported, open and explicitly not established

Structural portability	Strong as a research architecture: 120 adapters can be written with the same frozen questions while changing native variables through M_d.
External empirical superiority	Open. The decisive standard remains prospective, parity-controlled, untouched holdout plus independent replication.
Fundamental physical law	Not established. Physics adapters compile structurally; that is not evidence of a new interaction, conservation law or physical constant.
Universal consciousness	Treated as an ontological premise of this Atlas. Cross-substrate measurement and legibility remain open scientific/philosophical frontiers.
Mutual Uptick	Acceptance architecture is specified; broad domain-by-domain prospective passage remains open.
Simulation record	Includes retained negatives and exploratory positives; semantics-changed runs are not treated as confirmatory.

NUMBERS RETAINED

Validation and simulation register

Record	Number	Interpretation
360-test register	8 / 118 / 120 / 106 / 8	Source documented / phenomenon documented / partial-pending / kernel-open / not established.
250k routing-only ablation	2.224283%	Full telemetry burden reduction.
250k routing-only ablation	1.618167%	LERM/IAMF-P burden reduction.
250k routing-only ablation	1.546338%	Raw LERM burden reduction.
Corrected catch-basin	5.6696%	LERM + IAMF-P, exploratory after semantics change.
Corrected catch-basin	5.5567%	Full telemetry comparator.
Generic 1M-system heuristic	7.136%	Whole-system generic action average, lost to strongest local KPI.
Strongest local KPI	7.567%	Comparator in first 1M-system experiment.
Whole-system objective	7.9083%	Second 1M-system experiment.
Boundary MPC	7.8256%	Comparator in second 1M-system experiment.
Local KPI	7.506%	Comparator in second 1M-system experiment.
Full-telemetry next-carrier	7.488%	Comparator in second 1M-system experiment.
Individual-case wins	about 29%	Whole-system objective did not need to win every local case to improve aggregate consequential outcome.
121-test conformance suite	121 PASS	Conformance to source dossier, not scientific validation.

Glossary

PLAIN-LANGUAGE REFERENCE

The vocabulary of the Atlas

Action set $\mathcal{A}$

Feasible transitions genuinely available to the system under the frozen boundary.

BDI

Boundary Divergence Index: difference between local-optimal and consequential-optimal objective values.

Binding carrier

The receiving carrier whose capacity shortfall blocks Mutual Uptick.

Carrier C

A person, organ, account, node, habitat, reservoir, future generation or other system that receives displaced state.

Comparator a_0

Preregistered counterfactual action against which displacement is estimated.

Consequence topology

The set of receivers, paths, dimensions, delays and magnitudes through which a transition propagates.

Domain map M_d

Translation from raw domain reality into the evidence-grounded state used by the frozen kernel.

Hidden compensator H

A reserve, worker, caregiver, ecosystem, balance sheet or other carrier absorbing burden that makes local performance look better.

IAMF-P

Constructive operation that builds missing capacity at the binding carrier before the consequential transition.

LERM

Loss/excess/displacement tracing operation that predicts and reconstructs receiving consequence topology.

Mutual Uptick / MU+

Carrier-specific acceptance condition requiring every protected material carrier to clear preregistered thresholds.

NO ACTIVATION

Output when local and consequential decisions do not materially diverge.

NO FEASIBLE MU+

Output when displacement is identifiable but no feasible construction clears the protected-carrier gates.

RVG

Reserve / Value Gap: incoming burden minus absorption/recovery capacity.

Schema Σ

The representation through which a receiver recognizes and acts on a state.

UNKNOWN

Output when the causal/consequential quantity cannot be identified with the available evidence.

Ψ state

Coupled state containing history, environment, option topology, knowledge, capacity, consciousness and the variables relevant to agency/responsibility.

Adapter 120

Meta-adapter closing the 001-119 network through cross-substrate consciousness, temporal coexistence and system-of-systems dependency.

Primary Source Record

CANONICAL CORPUS

Source documents integrated into this edition

- Jefferson Rafael Rufino. *The Ledger of Consequence: Rewritten Edition of the Rufino Law, K_R v1.1*. 2026. Primary canonical kernel, ontology, Frontier Atlas, validation register and formula vault.
- Jefferson Rafael Rufino. *Rufino Synthesis End-to-End Playbook*. 2026. Operational synthesis and domain-translation record.
- Jefferson Rafael Rufino. *The Rufino Law Universal Reality Frontier Market Book, Research Edition*. 2026. Expanded research atlas and domain-native translation record.
- Jefferson Rafael Rufino. *Thermodynamic Economic Frameworks Analysis 2*. Earlier thermodynamic/economic development record.

The first 100 adapter cards in this edition preserve the canonical Frontier Atlas fields from the Ledger. Adapters 101-120 formalize the 2026 extension developed around conscious agency, responsibility, evolution, transformation and temporal coexistence. Adapter 120 is a closure operator over the preceding network, not merely a peer domain.

TO EXIST IS TO ENTER RELATION.

Once a state enters relation, it becomes consequential to other states. Stable existence therefore requires a viable architecture of coexistence.

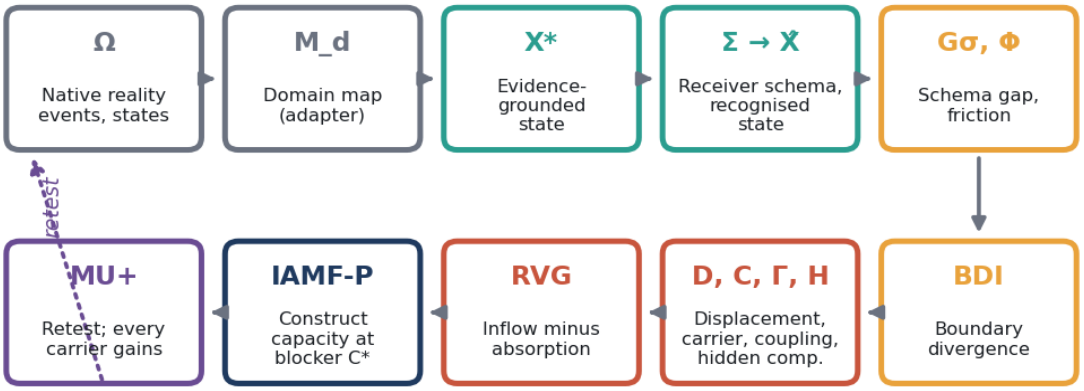
A REWRITTEN EDITION · K_R v1.1

THE LEDGER OF CONSEQUENCE

The Rufino Law of Consequential Displacement and Reconciliation, rebuilt chapter by chapter, with the full 360-test Validation Atlas, the 100-domain Frontier Atlas, and a visual atlas of translation across molecules, nodes, neurons, hops and social strata.



Same grammar in every domain. Only M_d, native units, observables and feasible actions change.

Research and mathematics
Jefferson Rafael Rufino, Founder / Architect, LERM + IAMF-P, Philippines

Rewrite, restructuring, new figures and toy simulations
AI-assisted synthesis (Claude, Anthropic), 5 October 2026

A note on this edition

You asked for a fresh take on the book, not a copy-edit. This edition keeps the author's mathematics, the K_R v1.1 kernel, the 360-test validation register, the 121-test conformance register and the 100-domain atlas, because those are the substance of the research. Everything around them has been rewritten: the argument is reordered so that a reader meets the idea before the machinery, the machinery before the applications, and the applications before the tests; the prose is new; and the visuals are new. Where the original asserted, this edition shows. Where the original left a diagram implicit, this edition draws it.

Three things are genuinely new here. First, **Part III** is a visual atlas of translation: the same consequential grammar drawn across a code-to-molecule channel, a multi-node network, a multi-neuron chain, a multi-hop communication path and a stack of social strata. Each comes with a small, seeded simulation whose results are printed in the text. Second, the book includes a **critical reading** of the law (Chapter 3), separating what is true by definition from what must be earned by experiment. Third, the toy experiments report their **negative results** alongside the positive ones, in the same spirit as the retained 250,000-case negative in the original.

Attribution rule (carried over from the original)

The research architecture and mathematics in this book are attributed to Jefferson Rafael Rufino as presented in the author-supplied corpus. AI-assisted work in this edition is limited to synthesis, restructuring, prose, figure design, toy-simulation design, test-register assembly and reporting. It is not presented as co-authorship of the originating mathematics.

Honest scope

This is a research monograph about a *proposed* law and a versioned audit protocol. Its own claim ledger (Chapter 29) lists what is supported, what is open and what is not established. Visuals and toy simulations are schematic, not empirical evidence. Appendix H lists known limitations. Medical, legal, financial, security and weapons-adjacent domains appear only as research architecture, never as treatment, advice or operational instruction.

How the book is organised

Table 1. Map of the book.

Part	What it does	Chapters
I. The Idea	Plain statement of the law, its discovery record, a critical reading, and the evidence grammar	1 to 4
II. The Machinery	Schema, boundary divergence, tracing, time, construction, Mutual Uptick, stopping rules, the whole kernel	5 to 14
III. One Grammar, Many Substrates	Translation visuals and toy experiments across molecules, nodes, neurons, hops and strata	15 to 21
IV. Applications	Friction economy, AI, climate (PHOTOSYNTHESIS), the Frontier Market Foundry	22 to 25
V. Testing the Law	Prior art, retained simulations, falsification, claim ledger, roadmap	26 to 30
VI. Validation Atlas	The 18-test battery applied to 20 branches: 360 named tests	full register
VII. Frontier Atlas	100 domain adapters in ten families, one construction brief each	full register
VIII. Practice	Four worked audits, a field guide with templates, objections and replies, misuse	31 to 34
Appendices	Formula vault, glossary, 121-test conformance register, design cards, reproducibility, references	A to H

PART I

The Idea

What the law says, where it came from, how to read it critically, and how to grade the evidence for it.

CHAPTER 1

The Law in Plain Terms

Most failures that look like surprises are not. A team hits its target and a different team inherits the cleanup. A hospital shortens its stay times and families absorb the care. A farm saves water and the river below runs thin. A model answers fluently and a human spends an hour verifying. In each case a local optimiser succeeded *by its own accounting*, and the unresolved remainder of the problem went somewhere the accounting did not look.

The Rufino Law says this is not an accident but a regularity, and that the regularity can be audited. In the author's words, a locally optimised open system can preserve apparent success by moving unresolved state beyond its declared boundary; unless that state is genuinely reconciled, it remains observable in one or more receiving carriers, coupling structures, compensating nodes, delayed periods or altered system states.

The law, formally

Displacement clause. A locally optimised open system can preserve apparent success by moving unresolved state beyond its declared boundary. Unless that state is reconciled, it stays observable in a receiving carrier, a coupling structure, a compensating node, a later period or an altered system state.
Constructive complement. Reconciliation is complete only when the consequential state has been captured, absorbed, transformed or productively reintegrated by sufficient capacity, and a later whole-system audit finds no equal or greater material burden displaced elsewhere or later.

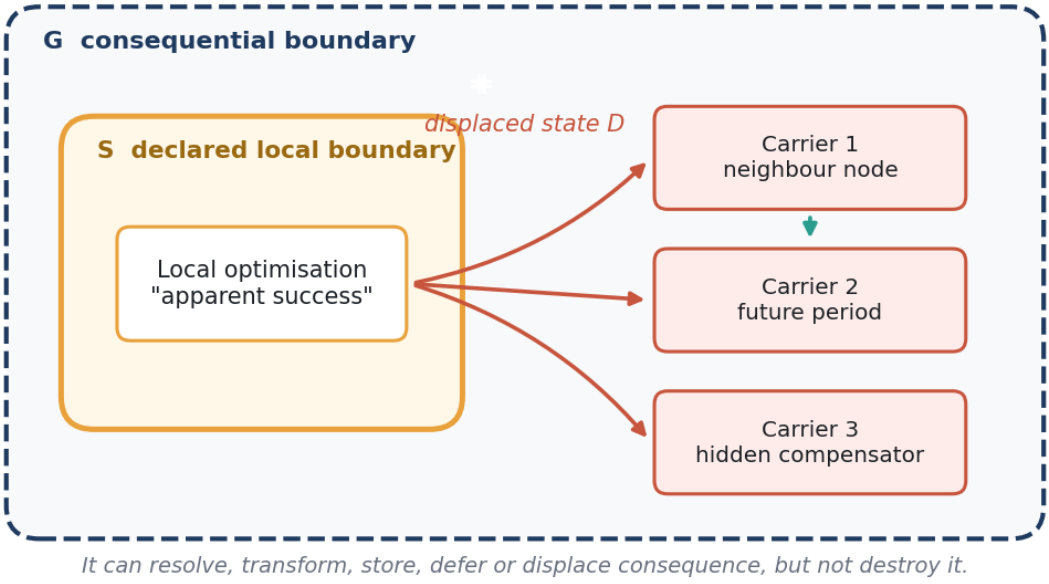

Figure 1. The core picture. A local optimiser succeeds inside S. Unresolved state crosses the boundary and lands in carriers inside the larger boundary G, including one that is hidden.

Three words carry the whole law

Boundary. Every optimiser works inside a boundary it has declared, explicitly or not: a budget line, a department, a quarter, a patient, a farm. The law asks for a second boundary, G, drawn around everything the action can materially affect. The distance between what looks best inside S and what is best inside G is the Boundary Divergence Index (BDI, Chapter 6).

Carrier. Displaced state does not vanish. It lands in something: a person, a household, an aquifer, a balance sheet, a future quarter, an unpaid worker, a downstream system. Naming the carrier is the first act of the audit and the thing most often skipped.

Reconciliation. To reconcile is to capture, absorb, transform or reintegrate the unresolved state with real capacity, not to move it again. The law is explicit that optimisation can resolve, transform, store, defer or displace consequence, but it cannot destroy it.

What makes this more than the idea of an externality

Economists have long known that private and social costs diverge. The law differs in three ways, each of which Chapter 26 tests against prior art. It treats the divergence as the first step of a *recurrent operator* rather than a single correction. It insists on tracing the displacement to a named carrier, including hidden compensators that make a system look stable. And it refuses to stop at diagnosis: the unit of progress is *construction*, building the missing capacity at the binding carrier, followed by a compulsory retest.

The pass condition sits above zero

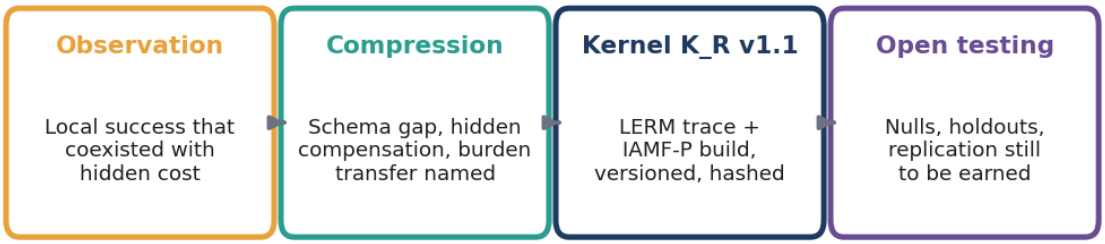
A common mistake is to treat "no one is worse off" as success. The author's pass condition is stricter. Zero is a *clearing point*: the ledger has no unaccounted sink. Success is **Mutual Uptick** (MU+): every material carrier exits with a positive, preregistered consequential gain. A carrier that is merely sacrificed, depleted or held flat so that another can claim the gain counts as a failure. Aggregate averages are not allowed to hide a losing carrier (Chapter 10).

The strictness is deliberate and it has a price. Many real interventions will fail MU+, and the kernel is required to say so rather than to relabel the failure. A law that could never fail its own test would be rhetoric. Chapter 11 describes the three honest non-positive outputs the kernel must be able to produce.

CHAPTER 2

Where It Came From: The Discovery Record

The law did not begin as an equation. According to the corpus, repeated lived, commercial, financial, organisational and institutional observations preceded the mathematics. The author calls the principal record **Index Case 001**, and the validation atlas treats it as the highest-resolution reference implementation. This chapter describes it at the level of systems, which is how the source itself treats sensitive events.



Direction of discovery: observation first, mathematics second, external validation last (and still open).

Figure 2. Direction of discovery. The operating record came first; the mathematics compresses recurring structure; external validation is the part still to be earned.

Why a single case can be informative but not decisive

The index record is unusually information-dense: a long chronology, several evidence classes kept apart, exact financial ledgers, a set of recurring contradictions, an eight-node operating architecture and explicit falsification rules. That density is why the equations have a traceable origin. But the book is careful about what a source record can and cannot show. It is *discovery provenance*, not independent proof of universality. A richly documented case can suggest a structure; only prospective tests on untouched systems can show that the structure transfers.

The lessons the record taught, mapped to the formal variables

Table 2. From the discovery record to the formal variables.

Observed pattern in the record	Lesson at systems level	Becomes in the kernel
Gross inflows that looked like wealth but were mostly pass-through	Throughput is not retained value; denominators must not be merged	Native-unit ledgers; no cross-unit sums
One person performing eight enterprise functions	Stability bought by a single biological carrier is a single point of failure	Hidden compensation H, carrier C*
The same underlying record read through family, bank, employer, clinic and court schemas	Each receiver recognises a different state of the same reality	Receiver schema Σ, schema gap Gσ
Recognised state changing access, and the outcome later read as proof of the recognition	A misread state can create the evidence that confirms it	Schema-causality test T03
Contradictions that dissolved when the reading frame widened	Truth is reconciliation between surface schema and evidential state	Truth baseline, provenance Q
Cycles of breakdown, evidence reconstruction, rule-making and governance	Repeated failure can be converted into institutional memory	Recurrent kernel and retest
Capability and impairment present at the same time	Do not subtract strength from friction; keep both visible	Vector-valued state, no fragmentation

The non-fragmentation rule

One discipline in the index record deserves emphasis because it generalises. The record was never allowed to collapse into a single story. Evidence classes (institutional records, visual evidence, contemporaneous notes, later synthesis, self-report, public context) were kept separate, and claims were graded into a small taxonomy: verified as worded, document-stated, conflicted, not established, killed. The same discipline appears at book scale in the evidence grammar of Chapter 4. A rich biography, like a rich dataset, becomes persuasive precisely when it is most tempting to blur its parts.

> **A caution on sensitive content**
>
> The index record involves a real person's history, finances and health-adjacent events. This edition describes them only structurally. The clinical and evidentiary guardrail in the source applies here too: nothing in this book is a diagnosis, a clinical claim or a legal conclusion about any individual or institution.

CHAPTER 3

Reading the Law Critically

A serious reader should ask of any proposed law: which parts are true by construction, which are claims about the world, and what result would make the author abandon it? This chapter answers those questions for the Rufino Law, using the author's own adversarial review as the starting point and adding one view of this edition: the strongest claim in the book is methodological, not metaphysical.

Three kinds of statement

Table 3. Not every sentence in the book has the same logical status.

Kind	Example in this book	What would count as evidence
Definition	BDI ≥ 0 when both optima are taken over the same feasible set	Nothing; it follows by construction
Formal consequence	RVG ≤ 0 means a carrier is not accumulating burden over the interval	Algebra, given the stated definitions
Empirical claim	Carrier-targeted construction beats routing, under information parity, on untouched systems	Sealed prospective tests and independent replication
Design commitment	Report NO ACTIVATION, UNKNOWN or NO FEASIBLE MU+ when warranted	Inspection of the kernel specification
Hypothesis	Structural homology across scales ("as above, so below") is testable	Cross-domain inter-rater mapping with null controls

The author's own formal-closure notes make the point. BDI is non-negative by construction, so the algebra is not the contribution. The contribution is the claim that a *preregistered* boundary, causal outcome definition and carrier set make BDI predictive of useful intervention differences. Chapter 21 demonstrates the distinction in a toy: when the local action is included among the candidates, estimated BDI is exactly zero in null systems and positive in displacing ones, but that is a property of the construction, not a discovery.

The unfalsifiability trap, and how the kernel avoids it

Any "everything is connected" framework risks always finding a hidden loser. The kernel is protected by four commitments. The null case is a first-class output (BDI within tolerance returns NO ACTIVATION). Unidentifiable histories return UNKNOWN. Exhausted construction returns NO FEASIBLE MU+. And the evidence grammar forbids upgrading a documented phenomenon into a kernel test. Ecology offers a concrete instance: protected areas sometimes leak deforestation elsewhere, sometimes block it and sometimes show no detectable external effect. A law worth keeping has to report all three.

Where the law is strongest

- **As an audit protocol.** The sequence boundary, counterfactual displacement, carrier, hidden compensation, capacity construction, retest is a checklist that catches real failures, and each step can be run without accepting any grand claim.
- **As a discipline about units.** Forbidding raw sums across pesos, joules, hours, mortality and trust prevents a common category of error.
- **As a standard of acceptance.** MU+ forces the question "who loses?" to be answered per carrier, with an uncertainty-aware bound.

- **As a record of its own failures.** The retained 250,000-case negative, the first million-system experiment that falsified a flat universal action, and the explicit non-pass branch for fundamental physics all raise the book's credibility.

Where it is weakest

- **Prior art is close.** Systems dynamics, critical systems heuristics, telecoupling, consequential life-cycle assessment, STAMP and resilience engineering each cover pieces of the sequence. The novelty claim is about the complete sequence as one operator, and the author presents it as a positive search result, not proof of priority.
- **Kernel-discriminating tests are mostly open.** Of 360 registered tests, 106 are still marked KERNEL TEST OPEN and 120 LINK PARTIAL (Chapter 29).
- **Simulation evidence is only as good as its release.** The supplied 250k artifact holds aggregates, not case-level rows, so some reported figures cannot be rerun from it.
- **Universality is easily over-read.** The 100-domain atlas is a construction brief, not 100 validations. Universality means the same grammar everywhere, not the same action everywhere.

> **This edition's view**
>
> Treat the Rufino Law as a candidate **standard of consequential audit** with a demanding acceptance rule, and treat the cross-domain "law of nature" language as a research programme. The first is already useful and testable. The second has to be earned domain by domain, and the book's own non-pass for fundamental physics shows the author understands that.

CHAPTER 4

The Evidence Grammar

The book's most reusable idea may be its insistence that evidence statuses are not interchangeable. A phenomenon documented in the literature is not a kernel test; a passing conformance suite is not scientific validation; a simulation is not an independent replication. The grammar below is applied to every branch of the 360-test register.

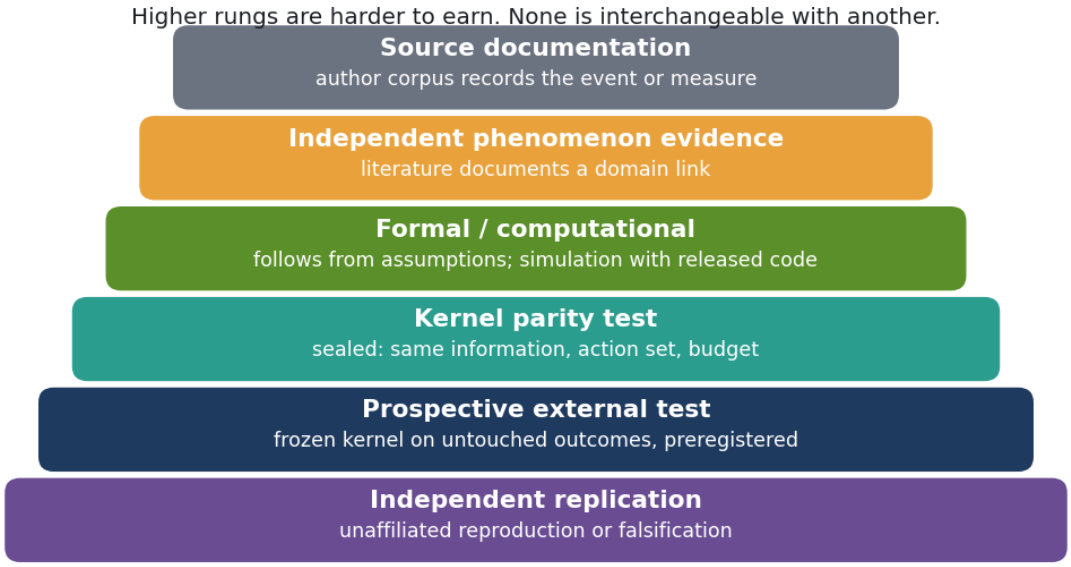


Figure 3. The evidence ladder. A claim sits on exactly one rung; moving up requires new evidence, not new wording.

Seven statuses used throughout

Table 4. The evidence-status grammar. Labels are not interchangeable.

Status	Definition	Typical example
SOURCE DOCUMENTED	The origin corpus documents the event or measurement	Ledger totals in the index record
PHENOMENON DOCUMENTED	Independent literature or data documents the domain phenomenon or one link in it	Farm-level efficiency failing to save basin water because return flows are reused
FORMAL / COMPUTATIONAL	Follows from stated assumptions, or from author-built simulation	BDI ≥ 0; the constructive-closure test
LINK PARTIAL	A constituent relation is measurable but not isolated end to end	Carrier prediction in a domain without a sealed test
KERNEL TEST OPEN	The frozen K_R version has not passed a sealed parity test	Most T14 to T16 cells
PROSPECTIVE EXTERNAL	Untouched outcomes tested with preregistration	None yet established in the corpus
INDEPENDENT REPLICATION	An unaffiliated group reproduced or falsified the result	None yet established in the corpus

Source classes P1 to P6, plus S and C

Table 5. Source classes.

Class	Meaning
P1 Primary authoritative	Institutional records, official telemetry, primary transactional records
P2 Peer-reviewed empirical	Independent studies and validated domain evidence
P3 Operational programme	Real programmes with documented outcomes
P4 Reputable contemporary reporting	Secondary reproduction where the primary table is unavailable

Class	Meaning
P5 Rufino formal synthesis	Canonical equations, operator, carrier ledger, non-displacement conditions
P6 Open design / hypothesis	Unvalidated pilot topology, transfer conjectures, maximal extensions
S Simulation	Architecture-class synthetic experiments and reported backtests
C Conformance	Software or document acceptance tests; not scientific validation

Why the grammar matters in practice

Consider the 121 conformance tests listed in Appendix C. They all pass, and they verify that the dossier preserves its chronology, exact numbers, contradictions and stated falsification conditions. That is valuable, but it is a statement about the *document*. A reader who confuses it with validation of the law would be making exactly the category error the grammar exists to prevent. Likewise a domain such as cancer ecology has strong independent literature showing that maximum-tolerated-dose strategies can select for resistance, which is a documented phenomenon matching the law's shape. It becomes a kernel test only when the frozen operator predicts the carrier, builds at the blocker and beats an information-matched incumbent on data it has not seen.

PART II

The Machinery

Schema, boundary, trace, time, construction, acceptance and stopping: the kernel K_R v1.1 explained one piece at a time.

CHAPTER 5

Schema, Truth and Legibility

The original law began one layer too late. Before a system can displace anything, it has to *represent* something, and representations are never complete. A schema is any operator through which a receiver sees the world: a form, a credit score, an ontology, a diagnosis code, a prompt, a budget line. The first layer of the kernel asks how far the receiver's picture is from the evidence-grounded state.

State, schema and the gap

$$X^*_t = M_d(\Omega_t) \qquad \hat{X}_t = \Sigma_r(X^*_t) \qquad G\sigma = \delta(X^*_t, \hat{X}_t)$$

Ω is underlying reality in domain d; M_d is the domain adapter that turns measurements into the best-supported state X^*; Σ_r is receiver r's schema; $\hat{X}$ is what the receiver recognises. Version 1.1 fixes the metric: one preregistered distributional distance family, with normalised Jensen-Shannon divergence (JSD) as the default. JSD is symmetric, bounded between 0 and 1 and defined even where one distribution has zero mass, which suits categorical schemas where a category may simply not exist for the receiver.

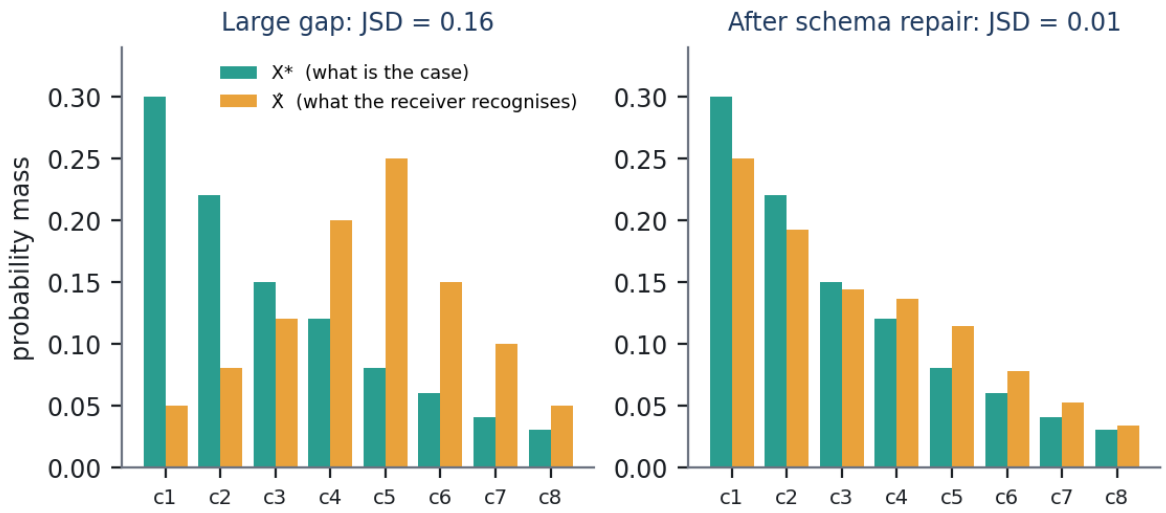

Figure 4. Schema gap as a distance between what is the case (X^*) and what the receiver recognises ($\hat{X}$). Left: a large gap. Right: after schema repair the same underlying state is recognised with JSD near zero. Illustrative distributions.

Friction: the cost of failed translation

When X^* and $\hat{X}$ differ, someone pays to bridge them: forms are refiled, claims are re-explained, documents are re-notarised, models are re-prompted. The kernel calls this the friction vector Φ and, in v1.1, measures it as the causal, incremental, native-unit cost of the representation state. Friction in hours is kept apart from friction in pesos or in trust; no hidden exchange rate is allowed.

Two upstream error channels

Table 6. Schema divergence and boundary divergence are different failures and are tested separately (T03 and T05).

Channel	Question	Example
Schema divergence	Does the receiver recognise the right state?	A benefits form with no category for irregular income

Channel	Question	Example
Boundary divergence	Even with the right state, is the optimiser looking at the right boundary?	A hospital measuring length of stay but not family caregiving load

Truth baseline and provenance

Truth auditing is framed as claim-to-evidence alignment through provenance, not as detecting lies. Each claim carries its source, timestamp, transformation and uncertainty, and is graded as aligned, contradicted or underdetermined. Intent is a separate evidentiary question and the kernel refuses to infer it from a factual contradiction. This single rule removes a large class of unfair accusations from any audit built on the law.

Structural homology across scale

The phrase "as above, so below" appears in the source as a testable proposition: that structurally similar schema, boundary and carrier relations recur from molecular to institutional scales. The testable form is modest. It predicts that the same kernel questions, once translated into native units, yield informative answers in domains at very different scales. Part III shows five such translations in schematic form. Whether the homology is deep or merely a useful analogy is exactly what inter-rater mapping and null controls are for.

Schema migration as an intervention

Sometimes the cheapest reconciliation is not new capacity but a better representation: adding a category, changing a form, publishing an interface contract, standardising a data model. Schema migration is therefore an IAMF-P action (Chapter 12), and the post-intervention audit re-measures Gσ to confirm the gap closed rather than moved.

CHAPTER 6

Boundary Divergence

The central diagnostic is simple to state. Take the best action according to the local objective J_S and ask how well it does according to the consequential objective J_G. Compare it with the best action according to J_G itself.

$$a^*_S = \operatorname{argmin} J_S(a; X^*) \qquad a^*_G = \operatorname{argmin} J_G(a; X^*) \qquad \mathbf{BDI = J_G(a^*_S) - J_G(a^*_G) \geq 0}$$

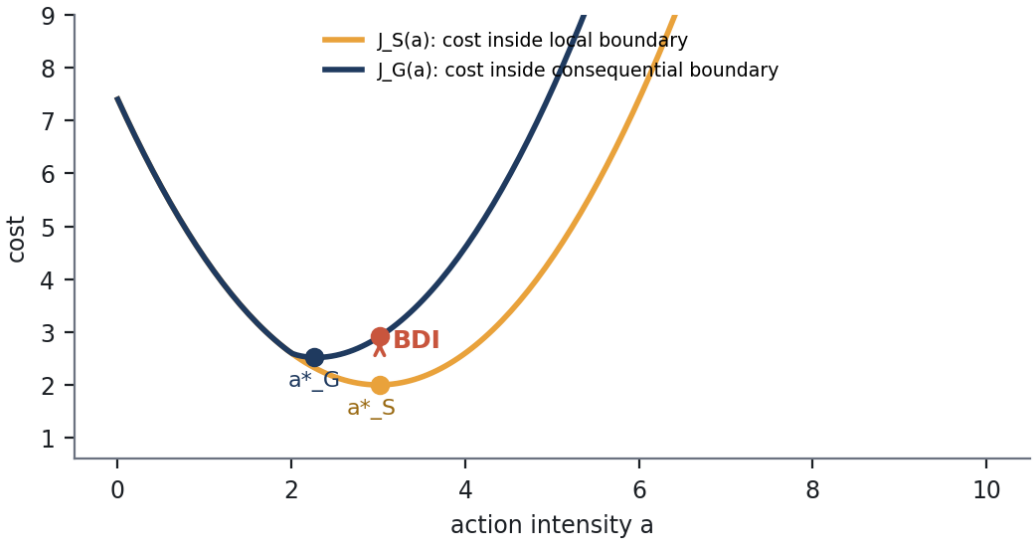

Figure 5. BDI as the gap, measured under the consequential cost J_G, between the action the local boundary prefers and the action the consequential boundary prefers.

What BDI is and is not

Because both minimisations run over the same feasible set, BDI is non-negative by construction. That makes it a defined quantity, not a discovery. Its empirical content comes from three preregistered choices: the boundary G with its horizon and inclusion rules, the causal definition of outcomes under J_G, and the claim that BDI predicts where an intervention will pay. A BDI near zero is a true null, the local boundary was adequate for this decision, and the kernel should stay quiet.

Declaring G before you look

The boundary, the time horizon, the carrier-inclusion rule and the materiality threshold must be declared from a causal or domain model *before* outcomes are inspected. Otherwise G can be widened until a loser appears, which would make the law unfalsifiable. The test T05 therefore fails if the divergence disappears under a correctly specified whole-system objective.

> **A practical rule of thumb**
>
> Draw G by asking, for each candidate affected party, "if the action doubled, would this party's native-unit outcome change by more than the materiality scale s?" Include the party if yes, and log the answer. The log is what a sceptic can audit.

CHAPTER 7

Displacement and the Carrier

Once the two boundaries disagree, the next question is where the difference went. The kernel defines a counterfactual displacement field, a causal estimand, for each receiving carrier j, native dimension k and delay τ:

$$D_a(j,k,\tau) = E[\, U_{j,k}(t+\tau) \mid do(a) \,] - E[\, U_{j,k}(t+\tau) \mid do(a_0) \,]$$

The comparator a_0 is a preregistered baseline: status quo, standard practice or best incumbent, not automatically "do nothing". Each domain must state how D is identified: randomised intervention, natural experiment, difference-in-differences, instrumental variable or a structural causal model. If the counterfactual is not identifiable, D is reported as UNKNOWN.

The LERM trace

$$L(X_t, a) = \{\, R_t, D_a, C_t, \Gamma_t, H_t, U_t, Q_t \,\}$$

Table 7. The seven outputs of the LERM trace operator.

Symbol	Meaning	Audit question
R	Unresolved residual	What was left over after the local action?
D	Counterfactual displacement field	How much moved, to whom, how late?
C	Receiving carrier	Who or what holds it now?
Γ	Coupling point or pathway	Through which link did it travel?
H	Hidden compensation	What is quietly holding the system together?
U	Unresolved burden	How much remains unreconciled?
Q	Observation and provenance state	How well do we actually know?

The binding carrier

For each carrier and dimension the kernel computes a capacity shortfall: the positive part of the displaced state minus the available absorption throughput, divided by a preregistered materiality scale.

$$\rho_{j,k,\tau} = \max(0,\, D^{+}{}_a(j,k,\tau) - A_{j,k,\tau}) \,/\, s_{j,k} \qquad C^*_t = \operatorname{argmax}_j \max_{k,\tau} w_\tau\, \rho_{j,k,\tau}$$

The binding carrier C* is the one whose shortfall, in its own native units, is largest after time weighting. Crucially, there is no sum across dimensions. Money, energy, hours, mortality and trust are compared by vector or Pareto reasoning, or by explicitly declared and sensitivity-tested weights, never by a silent exchange rate. The original specification's unit-summed carrier expression was identified as dimensionally invalid in the adversarial review and replaced.

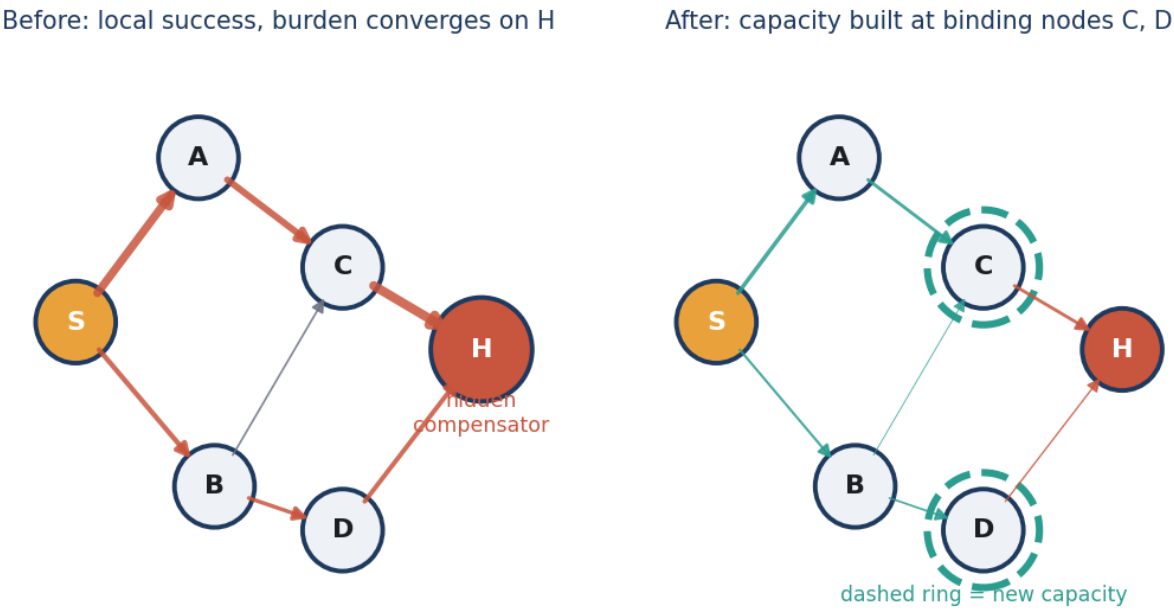

Figure 6. A schematic carrier network (toy). Left: local success at S sends burden through A and B, converging on a hidden compensator H. Right: capacity placed at the binding nodes C and D lets the burden be absorbed before it reaches H.

CHAPTER 8

Hidden Compensation

A system can look stable because something unseen is holding it together. The kernel states the point as an inequality of knowledge: **observed stability does not imply structural sufficiency**.

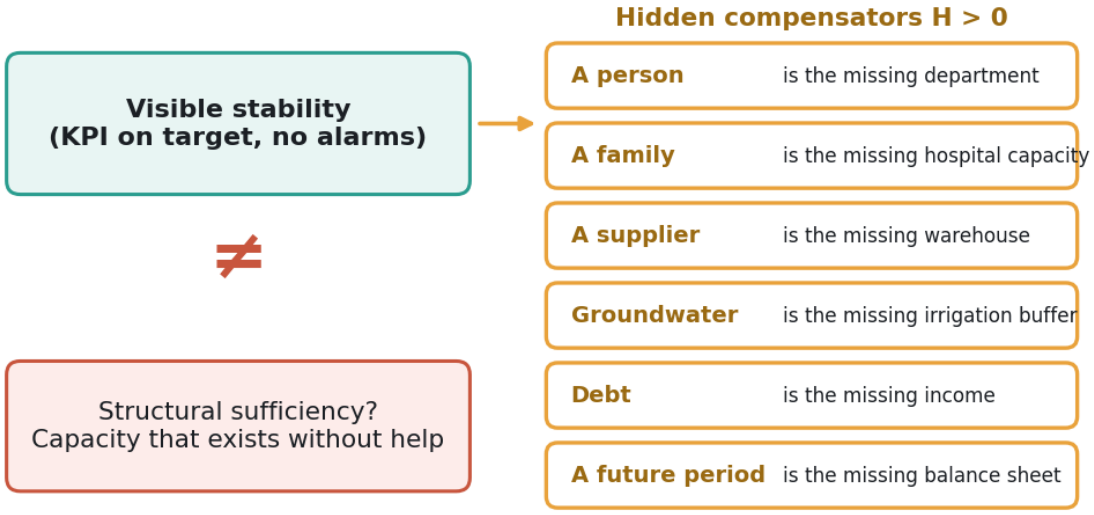

Figure 7. Hidden compensators. Each is a person, a relationship, an ecological buffer or a future period quietly supplying capacity that the system's own structure lacks.

How to test for a compensator

- Name the candidate: which node would the system fail without?
- Remove or separately measure it, ethically and in simulation where removal would harm someone.
- Ask whether visible performance falls. If it does not, the candidate was not holding anything up (T10 fails for it).
- Price it. Overtime, debt, deferred maintenance and informal caregiving all have native-unit costs that were not on the books.

The index record offered an extreme example: eight enterprise functions concentrated in one biological carrier. The same configuration demonstrated capability and exposed a single point of failure. The dialectic is the lesson. Capability and fragility were true together, and any audit that kept only one of them would have been wrong.

CHAPTER 9

Time and the Reconciliation Velocity Gap

Burden accumulates in time, and capacity may lag. Version 1.1 replaces a flawed earlier formula with a clean stock-and-flow definition. Let $b_j(t)$ be a carrier's unresolved burden stock, $\iota_j(t)$ the incoming burden rate and $\alpha_j(t)$ the realised absorption throughput, which cannot exceed available capacity $R_j(t)$.

$$db_j/dt = \iota_j(t) - \alpha_j(t) \qquad \mathbf{RVG_j(t) = \iota_j(t) - \alpha_j(t)} \qquad \alpha_j \le R_j$$

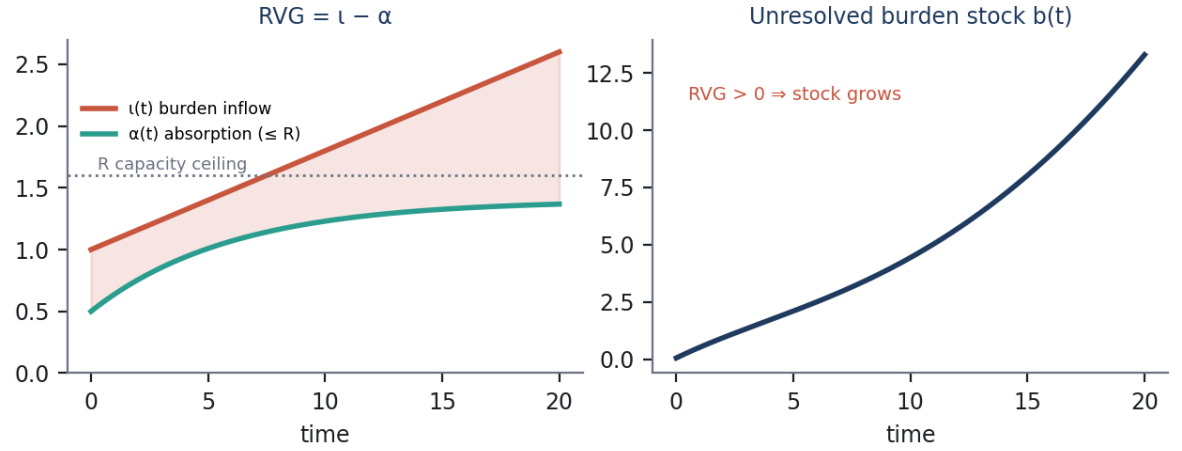

Figure 8. The Reconciliation Velocity Gap. Left: inflow rises while absorption saturates at the capacity ceiling. Right: the unresolved stock grows whenever RVG is positive.

RVG ≤ 0 means the carrier is not accumulating unresolved burden over the declared interval; RVG > 0 means the stock is growing. Capacity level R constrains how fast the system can absorb but is not itself differentiated and subtracted from inflow. This is the v1.1 correction of the superseded dU/dt − dR/dt form, which mixed a rate with a level.

Why the gap matters before the failure

A stock can look harmless for a long time. A positive RVG is an early signal: the burden is below any alarm threshold today but is growing faster than it is being absorbed. Test T11 asks whether RVG predicts impending accumulation or failure better than native time-series baselines. This is where the law could earn real predictive credit, and it is one of the cleanest tests to run.

Loss over time

The source also tracks an accumulated loss rate, the sum of avoidable, displaced and deferred loss over the interval. Keeping the three components separate matters: avoidable loss is a design failure, displaced loss is a boundary failure and deferred loss is a time-boundary failure.

CHAPTER 10

Mutual Uptick

This is the law's acceptance rule and its most demanding feature. Define, before any outcome is seen, a set G_m of protected material carriers using exposure and materiality rules. Then:

MU+ passes if and only if

(1) for every carrier j in G_m, the one-sided lower confidence bound of ΔV_j exceeds a preregistered positive threshold $\varepsilon_j \geq 0$; (2) every protected safety dimension stays within its hard constraint; (3) no new material burden concentration appears; and (4) $RVG_j \leq 0$ over the declared audit horizon.

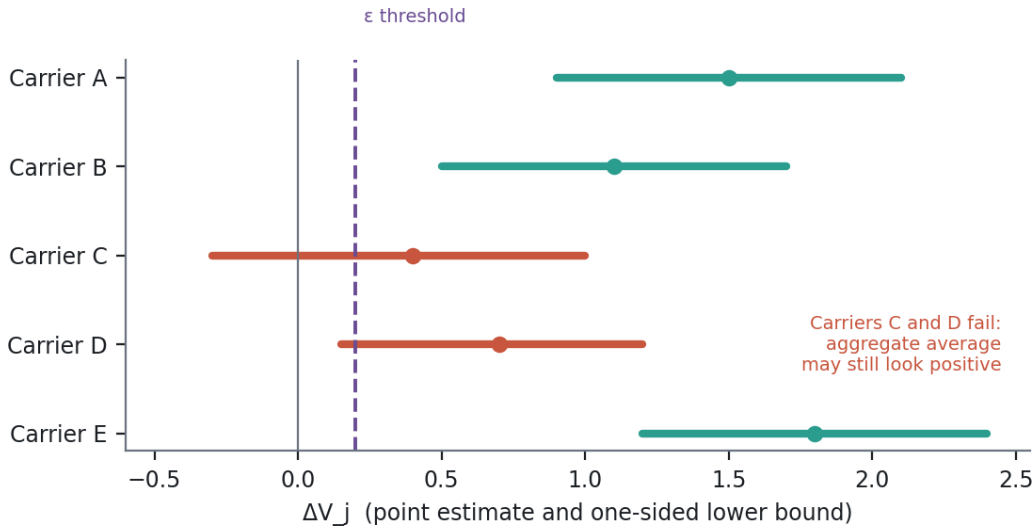

Figure 9. The MU+ gate. Each row is a carrier with its estimated gain and a lower confidence bound. Carriers whose lower bound does not clear ε fail the gate, even when the average across carriers looks positive.

Five features worth underlining

- **Uncertainty-aware.** A flat or statistically unresolved result does not count as positive.
- **Per carrier.** Aggregate averages cannot hide a loser.
- **Native units.** Each carrier gets its own value and safety function; a peso gain cannot cancel biological harm.
- **Adversaries are not beneficiaries.** A tumour lineage or a malicious attacker is modelled as an adverse state process, not a welfare-bearing carrier.
- **Infeasibility is a legitimate output.** If no physically, legally, ethically or safety-valid construction can satisfy MU+, the answer is NO FEASIBLE MU+ UNDER CURRENT CONSTRAINTS, not an endless rescue loop.

Zero is a clearing gate, not success

The state 0_R means no material unreconciled displacement above tolerance. It is dynamic closure of the ledger. The charter reproduced in Appendix B keeps both gates: non-displacement is necessary but not sufficient, and full reconciliation requires co-elevation.

CHAPTER 11

Stopping Rules and Honest Outputs

A kernel that always activates is a template for confirmation. K_R v1.1 therefore requires three non-positive outputs alongside the single positive one.

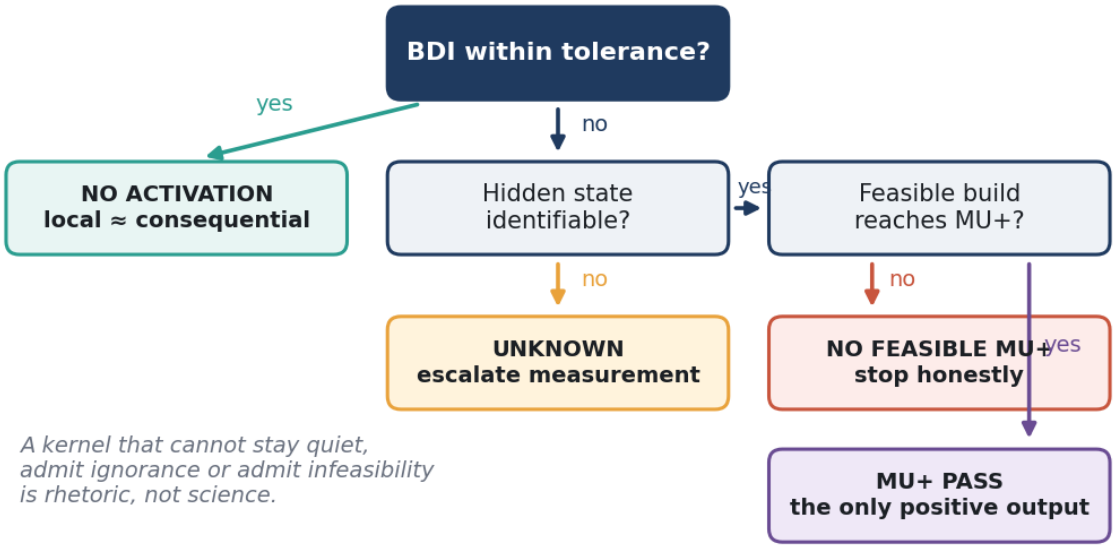

Figure 10. The four possible terminal outputs. Only one is positive. A serious kernel must be able to stay quiet, admit ignorance and admit infeasibility.

Identifiability

$$H(O) = \{ H_i : F(H_i) = O \}$$

If materially different histories remain observationally equivalent, that is, the set H(O) contains histories with different carriers or counterfactuals, the correct result is UNKNOWN. The response is to stop or to escalate measurement, not to pick the most dramatic story. Many real audits will end here, and the kernel treats that as a result, not a failure.

Table 8. Terminal outputs of the kernel.

Output	Trigger	What the operator does next
NO ACTIVATION	BDI within preregistered tolerance	Stay lightweight; do not add bureaucracy
UNKNOWN	Carrier, counterfactual or receiver schema not identifiable	Specify the measurement that would resolve it
NO FEASIBLE MU+	All admissible constructions exhausted without clearing the gate	Report the binding constraint; stop
MU+ PASS	Gate cleared with uncertainty-aware bounds	Monitor; schedule retest

CHAPTER 12

Constructing Capacity: IAMF-P

LERM diagnoses; IAMF-P builds. The constructive operator searches over admissible architectures A for the one that minimises residual burden, hidden compensation, worst-carrier burden and cost, while maximising whole-system value.

$$A^*_t = \operatorname{argmin}_{A \in \square} [\, U_G(A) + \lambda \cdot H_CC(A) + \mu \cdot U_max(A) + \nu \cdot Cost(A) - \eta \cdot V_G(A) \,] \qquad R_new(C^*) = R(C^*) + \Delta R_built$$

The question changes from "who can bear this loss?" to "what structure would make bearing this loss unnecessary, or materially smaller?" Routing burden through whatever capacity already exists is the weaker move. The retained 250,000-case negative (Chapter 27) shows what happens when intervention semantics are reduced to routing: the operator did not dominate.

Four families of construction

Table 9. IAMF-P action families.

Family	What it adds	Typical example
Schema migration	A better representation	New data contract; new eligibility category
Capacity construction	Absorption throughput at C*	Cooling hub; respite care; buffer storage
Transformation	Conversion of displaced state to value	Waste heat to power; surplus food to feed
Governance	Rules that keep the ledger open	Return-flow accounting; outcome ledgers

Productive reconciliation and Net Reconciled Value

$$D \to \text{capture} \to \text{transform} \to D', \quad V(D') > V(D) \qquad NRV_{vec} = [\text{AvoidedBurden}, \text{ProductiveValue}, \text{ReleasedCapacity}, -\text{Capex}, -\text{Opex}, -\text{NewDisplacement}, -\text{DeferredBurden}]^T$$

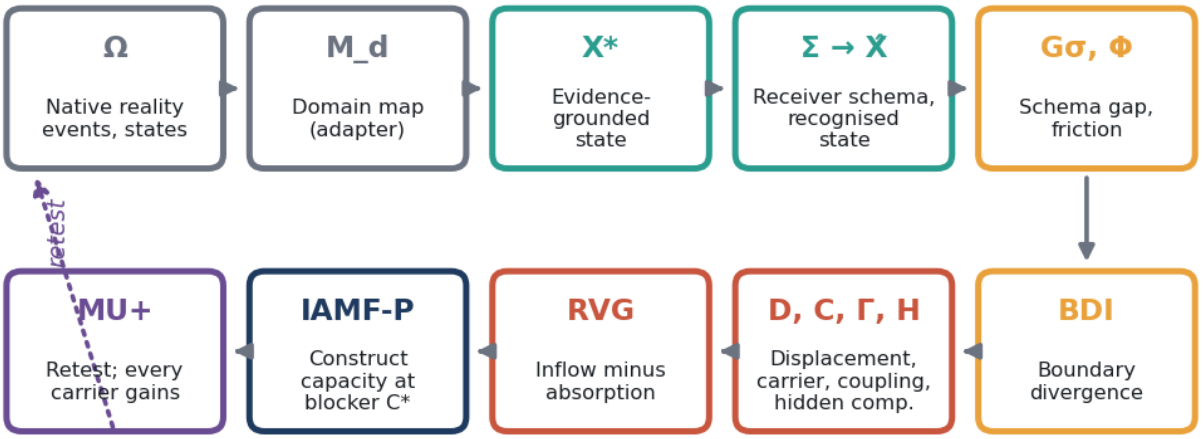
Where physics and economics permit, displaced state can be converted into higher-utility value. The transformation must still pass the whole-system audit; productive value does not excuse a hidden burden elsewhere. NRV stays a vector. A scalar may be reported only with preregistered conversion or multi-criteria weights and a sensitivity analysis.

Figure 11. Toy phase diagram: when does building at the binding carriers pay? Colour shows build minus baseline. Building pays when burden is large and capacity is cheap, and loses when it is not (Chapter 21).

CHAPTER 13

The Whole Kernel and Its Version History

Putting the pieces together gives one recurrent pipeline, the same in every domain.



Same grammar in every domain. Only M_d, native units, observables and feasible actions change.

Figure 12. The K_R v1.1 pipeline. Reality is mapped to a state, the receiver schema and boundary are examined, displacement is traced, capacity is built at the binding blocker and the whole system is retested.

$$\Omega_t \to M_d/Q \to X^*_t \to \Sigma_r \to \tilde{X}_t \to (G\sigma, \Phi) \to (B_L, B_G) \to L \to (BDI, D, C, \Gamma, H, RVG) \to IAMF\text{-}P \to A^*_t \to F_d \to X^*_{t+1} \to \text{retest}$$

What changed from v1.0 to v1.1

Table 10. Corrections from the adversarial specification review.

v1.0 issue	K_R v1.1 correction
Two schema-gap formulas	One preregistered distance family; normalised JSD by default
Free-form friction term Ψ	Friction measured as causal, incremental, native-unit cost of representation state
Unit-summed carrier selection	Capacity-shortfall ranking in native units with preregistered scaling only
RVG = dU/dt − dR/dt	RVG = burden inflow rate − realised absorption throughput
Two MU+ definitions	One strict uncertainty-aware positive-gain rule for protected carriers
Recurrence used M_d^{-1}	Domain-valid transition / actuation map F_d only; a state map is many-to-one and need not invert

The specification is versioned and anchored by a SHA-256 hash of its compact string: `e508958647f3b5b0e9c2ed07a6770abc44ca76b5eb5d23b562ac8b59421db743`. The hash is a provenance anchor, not a claim that prose is cryptographically immutable. Any semantic change to Gσ, BDI, D, carrier selection, RVG, IAMF-P or MU+ requires a new kernel version, and every validation must state which version it used.

Law versus definition, once more

A useful way to hold the whole structure is to ask which of the kernel's elements could be wrong about the world. The definitions (BDI, RVG, NRV) cannot be wrong, only unhelpful. The empirical claims are that the frozen operator improves carrier identification and consequential intervention, on untouched systems, against strong incumbents with matched information. That is where the book places its research programme.

CHAPTER 14

RSO: The Operator as an API

The cleanest technical reading of the cross-domain claim is an API contract. The domain science provides a map; the Rufino Synthesis Operator (RSO) consumes the mapped state and runs the same grammar.

Table 11. The RSO API contract.

Layer	Symbol	Required function	Non-negotiable constraint
Input reality	Ω	Native events, state, actors, measurements, uncertainty	Preserve provenance and missingness; never manufacture state
Domain adapter	M_d	State map, units, observation model, causal graph, feasible actions	Native units; no silent conversion
Receiver schema	Σ	Accepted variables, categories, exclusions, blind spots	Declare before outcomes
Boundaries	B_L, B_G	Local and consequential boundaries with horizon	Preregistered inclusion rules
Trace	L	D, C, Γ, H, U, Q	Carrier-by-dimension ledger
Construction	A*	Capacity or schema action at C*	Budget and safety constraints
Retest	—	Re-measure Gσ, Φ, BDI, D, H, RVG, NRV	Compulsory; worst-carrier reported

Pseudocode

```
def RSO(Omega, adapter, schema, bounds, actions):
  X = adapter.state(Omega) # X*, with provenance Q
  G = schema_gap(X, schema.recognise(X)) # normalised JSD
  bdi = divergence(bounds.local, bounds.global_, X, actions)
  if bdi <= tol: return NO_ACTIVATION
  D = displacement(X, actions, comparator) # causal estimand
  if not identifiable(D): return UNKNOWN
  C, path, H = carriers(D), couplings(D), hidden(D)
  for build in candidate_builds(C.binding, budget):
    post = adapter.act(X, build)
    if mu_plus(post, protected_carriers): return PASS(build)
  return NO_FEASIBLE_MU_PLUS
```

A minimal domain adapter

- State variables and units, with an observation model and known missingness.
- The receiver schemas that act on this state, including exclusions and blind spots.
- A causal graph or other identification strategy for displacement, with horizons.
- Feasible interventions, with costs, safety limits and legal or ethical constraints.
- Materiality scales s, tolerances ε and the protected carrier set, declared before outcomes.
- The incumbent comparator and the information-parity design (Chapter 28).

PART III

One Grammar, Many Substrates

A visual atlas of translation: the same consequential questions asked of a code-to-molecule channel, a network of nodes, a chain of neurons, a multi-hop message path and a stack of social strata. Every experiment here is a small seeded toy, labelled as such.

CHAPTER 15

The Ontology of Substrates and the Domain Compiler

The strongest practical claim of the law is portability: one grammar, many substrates. That claim needs a way to say what a "substrate" is without writing an endless list of industries. The book's answer is to define reality by *coordinates*.

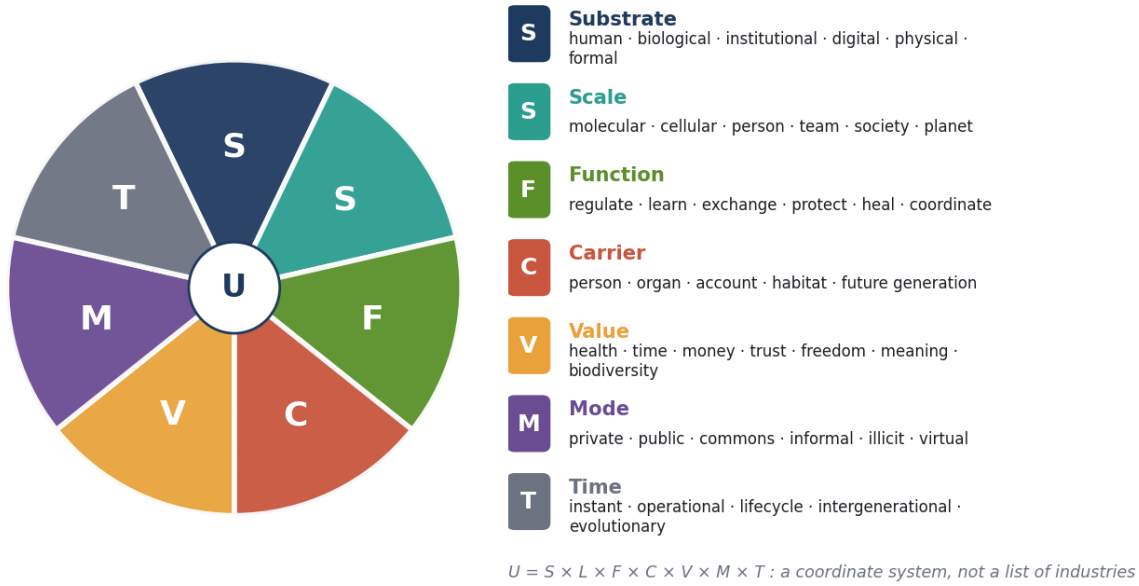


Figure 13. The seven axes of the universal reality ontology. A newly discovered domain does not need a new law; it needs a new point in this space, a domain map M_d and a feasible-action set.

Table 12. The seven axes of completeness. U = S × L × F × C × V × M × T.

Axis	Question	Examples
Substrate (S)	What is the system made of or instantiated in?	human, biological, institutional, digital, physical, formal
Scale (L)	At what level do states and carriers exist?	molecular, cellular, individual, team, organisation, society, planet, cosmos
Function (F)	What is the system trying to do?	regulate, learn, exchange, protect, heal, create, coordinate, reproduce
Carrier (C)	What can receive displaced state?	person, organ, account, team, node, habitat, reservoir, future generation
Value (V)	What can improve or deteriorate?	health, time, money, energy, trust, freedom, meaning, biodiversity
Mode (M)	How is value organised or exchanged?	private, public, commons, informal, illicit, virtual, unknown
Time (T)	When do consequences become material?	instant, operational, lifecycle, intergenerational, evolutionary

The constructive domain compiler

$$C_d : (K_R, M_d, O_d, A_d) \to (\Sigma_d, \delta_d, \Phi_d, D_d, C_d, B_d, \Delta R_d, Q_d)$$

Given the frozen kernel, a domain map, observables and a feasible action set, the compiler must emit more than prose: native equations or state relations, a schema model, measurable friction and carrier variables, the incumbent comparator, a blocker detector, a construction, an MU+ ledger, falsifiers and a prospective test. In regulated or safety-critical domains the output is a research architecture, not a treatment, a legal decision, a weapons instruction or a deployment

authorisation.

What the next five chapters do

Each of the next five chapters takes one substrate and runs the compiler by hand, producing a figure and a small simulation. They are not evidence that the law holds in those domains. They are demonstrations that the questions the kernel asks (what is the schema, where is the gap, where does the burden land, what would capacity do) have well-defined answers in very different kinds of system, and that the answers are sometimes unflattering to the law.

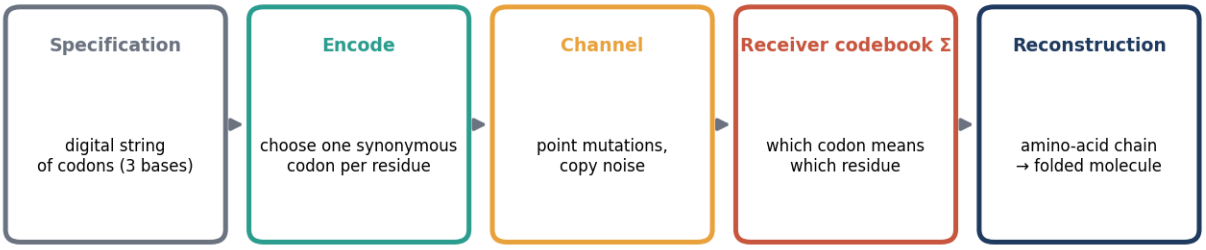
Table 13. Substrate-by-substrate plan.

Chapter	Substrate	Schema Σ	Carrier	What construction means
16	Code to molecule	Genetic codebook	Residue chain	Reconcile the codebook; do not just add redundancy
17	Network of nodes	Node-local KPIs	Hidden compensator H	Capacity at binding nodes
18	Neuron chain	Synaptic gain at each stage	Slowest synapse	Widen the narrowest stage, then retest
19	Multi-hop message path	Per-hop translation	Worst hop	Repair the lossiest translation
20	Social strata	Stratum-local optimisation	Lowest strata	Targeted capacity, with funding audited

CHAPTER 16

Code to Molecule: Translation Across a Codebook

Life offers the cleanest physical example of a schema. A digital string of codons is translated, through a codebook, into a chain of amino acids that folds into a molecule. The molecule is the "reality"; the codon string is the specification; the codebook is the receiver's schema. If sender and receiver disagree about the codebook, the reconstruction is wrong however carefully the string is copied.



Gσ = fraction of codon assignments on which sender and receiver disagree. Redundancy buffers noise, but cannot buffer a mismatched codebook.

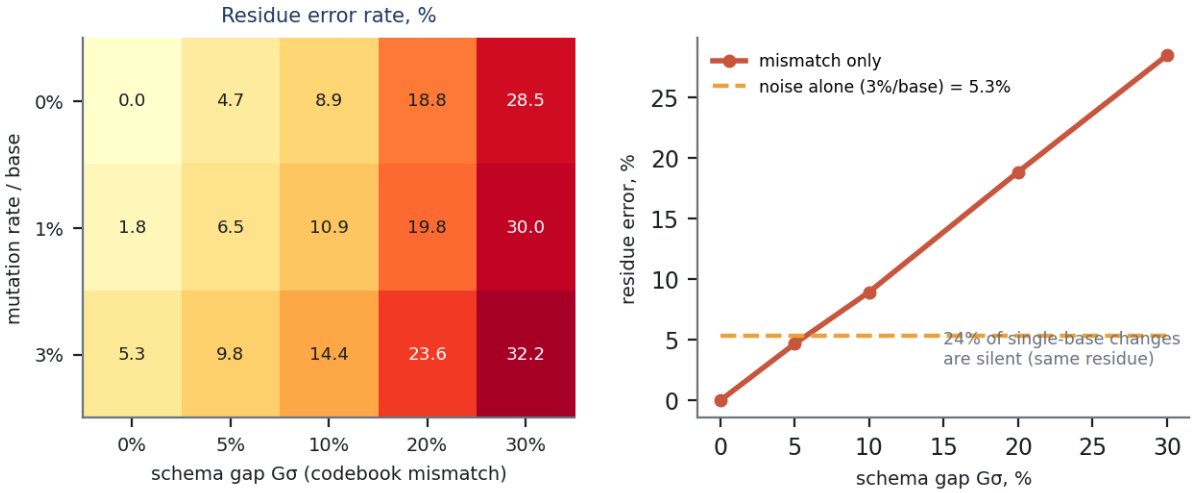


Figure 14. Top: the code-to-molecule channel. Bottom left: residue error rate as the schema gap (codebook mismatch) and mutation rate vary. Bottom right: mismatch alone versus noise alone. Toy simulation using the standard genetic code; seeds fixed.

The experiment

A 60-residue protein is encoded by choosing one synonymous codon per residue at random, passed through a channel with per-base point mutations, and decoded by a receiver whose codebook differs from the sender's on a fraction of codons (the schema gap Gσ). Each cell of the heat map averages 300 random proteins.

What it shows

- With no mismatch and no noise the error is zero, as it should be.
- **Noise is partly absorbed.** At a 3% per-base mutation rate and a matched codebook the residue error is 5.3%, far below what 3% per-base error would suggest, because 24% of single-base changes are silent: the genetic code has built-in redundancy.
- **A schema gap is not absorbed.** A 10% codebook mismatch produces roughly 8.9% residue error with no noise at all, and a 30% mismatch produces about 28%. Error grows almost one-for-one with the gap.
- The two sources of error add roughly independently: at 10% mismatch plus 3% mutation the error is 14.4%.

> **Kernel reading**
>
> Redundancy is a *capacity* that buffers noise. It cannot buffer a wrong schema. The IAMF-P move is therefore schema migration, aligning the codebook, not more redundancy. In the original's grammar: Gσ is measured, Φ is the cost of failed reconstruction, and the repair is a representation change, not a routing change.

Limits of the analogy

This is a communication-channel toy, not molecular biology. It does not model folding, tRNA wobble, codon bias or selection. It is included because it shows, in a system where the schema is physically explicit, the difference between noise and mismatch, a distinction the law relies on everywhere else. Whether institutional schemas behave like codebooks, with errors that grow in proportion to the mismatch, is an empirical question for T02 and T03.

CHAPTER 17

Multi-Node Transfer: Where the Burden Converges

Replace molecules with nodes: departments, suppliers, hospitals, accounts. Local optimisation at a source node S sends burden along couplings. The kernel's question is where the flows converge and whether the convergence point has the capacity to absorb them.

Reading the network figure

In the network figure of Chapter 7 the thick red edges mark heavy flows. Both main routes from S converge on node C and, through it, on H, the hidden compensator, which was never designed to absorb burden but ends up carrying the largest share. The kernel's carrier-selection rule picks, among all nodes, the one with the largest native-unit capacity shortfall. Building capacity at C and D, the narrow points on the heavy routes, relieves H without touching S's local optimisation at all.

A key distinction: routing versus construction

Table 14. Three responses to a displacement pattern. The kernel favours the third only when it pays.

Move	What changes	Weakness
Re-route	Which path the burden takes	Moves burden to another carrier; may overload it
Re-select action	What S does	Costs S some of its local gain
Construct capacity	How much each node can absorb	Costs capex; only pays if burden is large enough

Chapter 21 quantifies when construction pays in a population of random networks. The result is humbling and instructive: re-selecting the action is cheap and usually better, and construction wins only where burden is large and capacity is cheap.

CHAPTER 18

Multi-Neuron Transfer: The Slowest Synapse

A chain of neurons passes a signal stage by stage. Each stage has a finite throughput, and a stage that cannot pass what it receives accumulates a backlog. This is the simplest honest model of a binding carrier: the system's throughput is set by its narrowest stage, and capacity added anywhere else does nothing.

Eight-stage chain; bar = synaptic throughput capacity per step. Stage 4 is the binding carrier.

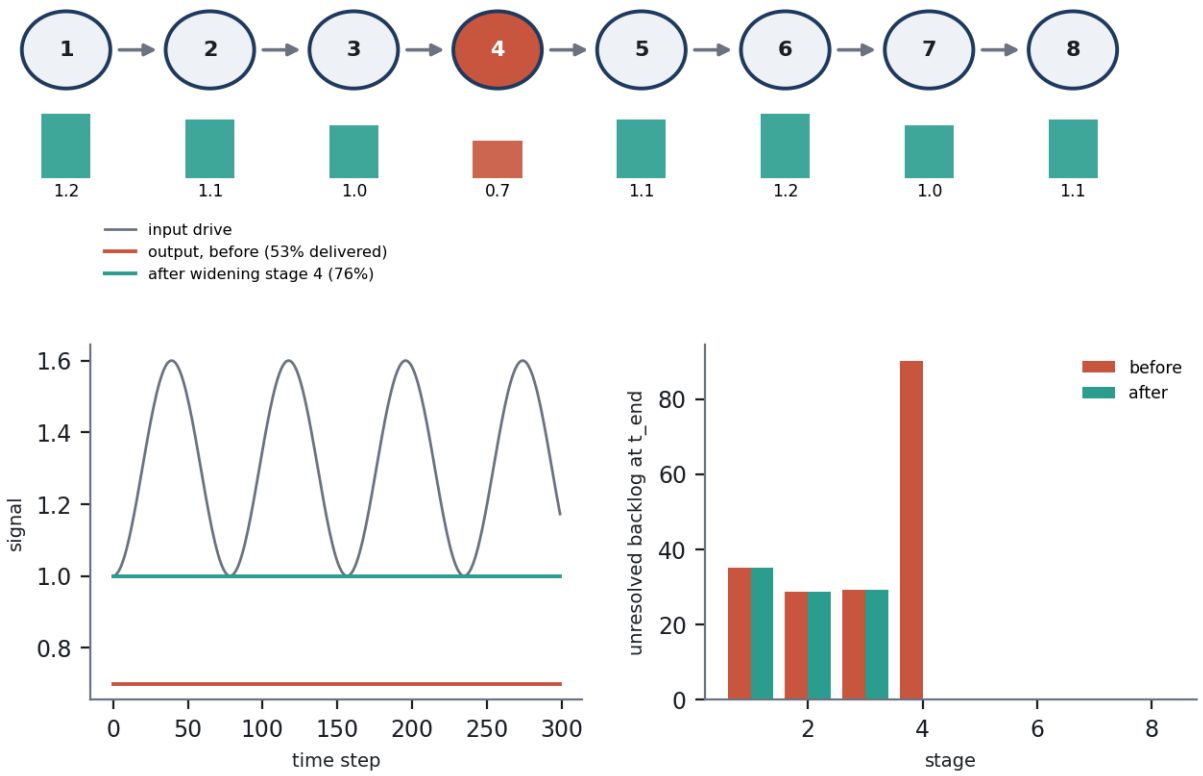

Figure 15. Eight-stage chain with finite per-stage throughput (toy). Stage 4 is binding. Widening it raises delivered signal and drains its backlog, but the bottleneck then migrates.

The experiment

Input drive oscillates around 1.3 units per step. Stage capacities are 1.2, 1.1, 1.0, 0.7, 1.1, 1.2, 1.0, 1.1. Over 300 steps, buffers hold what a stage cannot pass.

- Before: the chain delivers **53%** of the drive; the output is pinned at the capacity of stage 4 (0.7).
- After widening stage 4 to 1.7: delivery rises to **76%**, and total backlog falls from 183 to 93 units.
- Delivery does not reach 100%. The next-narrowest stages (capacity 1.0, stages 3 and 7) now bind, and the backlog that remains sits upstream of them.

Kernel reading

This is the "retest, then find the next bottleneck" step of the recurrent kernel in miniature. Capacity at the binding carrier helped a lot, and reopening the ledger immediately revealed a new binding carrier. A one-pass intervention that stopped after stage 4 would have declared victory at 76% delivery. The kernel's refusal to stop until every material carrier clears its gate is the difference.

Limits

This is a queueing toy with deterministic capacities, not a model of any real neural circuit. It is offered as a clean statement of the binding-carrier idea and of why "capacity added somewhere" is not the same as "capacity added at C*".

CHAPTER 19

Multi-Point Communication: Meaning Across Many Hops

Human and machine communication often passes through many intermediaries: translators, forms, handoffs, relays. At each hop the message is translated between two schemas and some meaning is lost. The loss compounds multiplicatively, which is why long chains are fragile even when every hop is individually decent.

Each hop translates between two schemas and loses some meaning. Repair only the worst hop (σ_4) and compare.

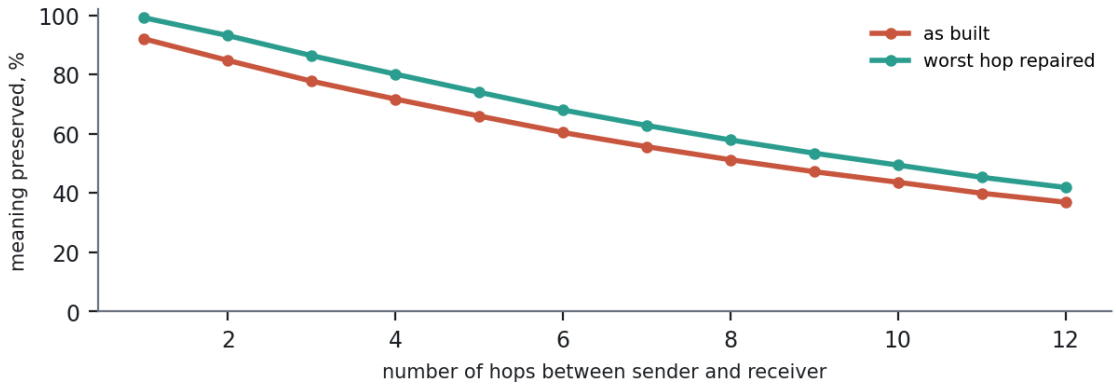

Figure 16. Meaning preserved across a chain of hops (toy). Each hop loses a random 2 to 14% of meaning. Repairing only the single worst hop recovers a few points per chain at every length.

The experiment

For each chain length from 1 to 12 hops, per-hop mismatch loss is drawn uniformly between 2% and 14%, and the preserved fraction is the product of the survival probabilities. The "repair" arm reduces the worst hop's loss by 90%. Each point averages 1,000 chains.

- One hop: 92.1% preserved as built, 99.2% after repair.
- Six hops: 60.5% as built, 68.1% after repair.
- Twelve hops: 36.9% as built, 41.9% after repair.
- Repairing one hop yields a gain of about 7 points at six hops and 5 points at twelve: real but modest.

Kernel reading and a warning

The binding hop is worth repairing first, and the gain is largest relative to cost. But repairing one hop in a twelve-hop chain still leaves most meaning lost. The deeper remedy is **fewer hops or a shared schema**: schema migration at the whole-chain level. The toy cannot tell you which is cheaper in any real setting. It only shows that the arithmetic of compounding makes the worst-hop heuristic necessary but far from sufficient.

Communication between social classes

The same arithmetic applies when a message crosses institutional and class boundaries: an eligibility rule written by an agency, interpreted by a caseworker, explained by a volunteer and acted on by a household. Each handoff re-encodes the message in a different vocabulary, and the household bears the residual. The kernel's contribution is to make the carrier explicit (the household), measure the friction in native units (hours, documents, repeat contacts) and test whether shortening the chain, or building a shared schema, reduces the burden without moving it to the caseworker. The OECD finding cited in Chapter 22, that only a minority of member countries systematically measure the transaction cost services impose on users, suggests this ledger is still mostly unmeasured.

CHAPTER 20

Social Strata: Burden That Flows Downhill

When optimisation at higher strata pushes cost onto lower ones, the carrier with the least capacity receives the most burden relative to its means. This is the most delicate substrate in the book because the carriers are people, and because the intervention that looks obvious (give the lowest strata capacity) raises the question the law insists on: who pays?

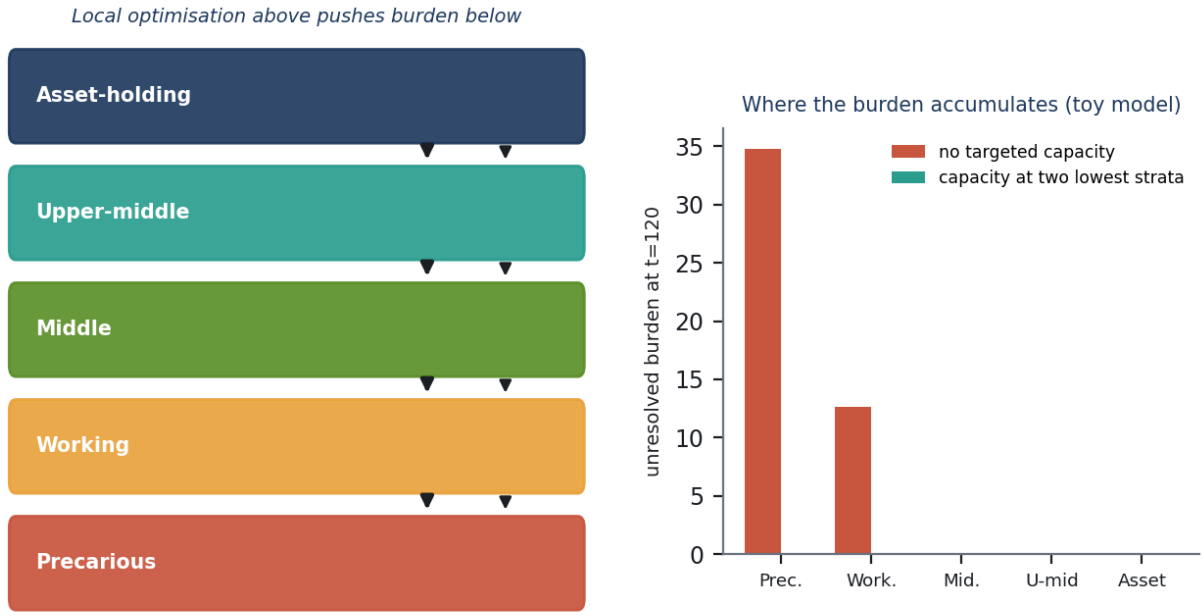

Figure 17. Left: local optimisation above pushes burden below, with thicker arrows to the immediate stratum. Right: unresolved burden after 120 periods in the toy, with and without targeted capacity at the two lowest strata.

The toy model

Five strata with capacities 0.4, 0.8, 1.3, 2.0 and 3.2. Each stratum generates its own burden and passes fixed shares downward through a displacement matrix. Without targeted capacity, burden accumulates at the lowest strata: the precarious stratum ends at about 35 units of unresolved burden and the working stratum at about 13, while the upper three accumulate none. Adding 1.0 and 0.6 units of capacity to the two lowest strata brings both to zero.

What the toy does not show

- **No funding.** The added capacity is free in the toy. In reality someone pays, and MU+ requires that the payer, whoever it is, is not made worse beyond tolerance. A model that ignored this would fail T14.
- **No behaviour.** Strata do not respond, resist, migrate or adapt.
- **No dignity or agency.** Carriers here are accounts, not people. Real interventions must not treat a carrier as a passive sink.

Kernel reading

The law does not say that redistribution is good or bad. It says that a transfer is acceptable only if every material carrier, *including the funding stratum*, ends better off by a preregistered lower bound, and that unresolved burden at the lowest carriers is an early-warning signal (positive RVG) worth measuring. The book is explicit that labour, capital, communities and tax bases are themselves carriers when an economy changes (Chapter 22).

CHAPTER 21

The Toy Experiments in Full

This chapter collects the remaining small simulations and reports them with their negatives. All use fixed seeds and are generated by the script released with this edition (Appendix E).

Experiment A: can BDI tell null systems from displacing ones?

3,000 random 12-node networks, 25% of them *null* (no burden crosses the local boundary). Four strategies: a local-KPI action, a boundary-aware action chosen by sampling candidate actions under the consequential objective (with the local action among the candidates), building capacity at the two most burdened carriers (with a cost of 0.45 per unit), and a gated rule that builds only if BDI is at least 0.05 or the worst carrier is above a threshold.

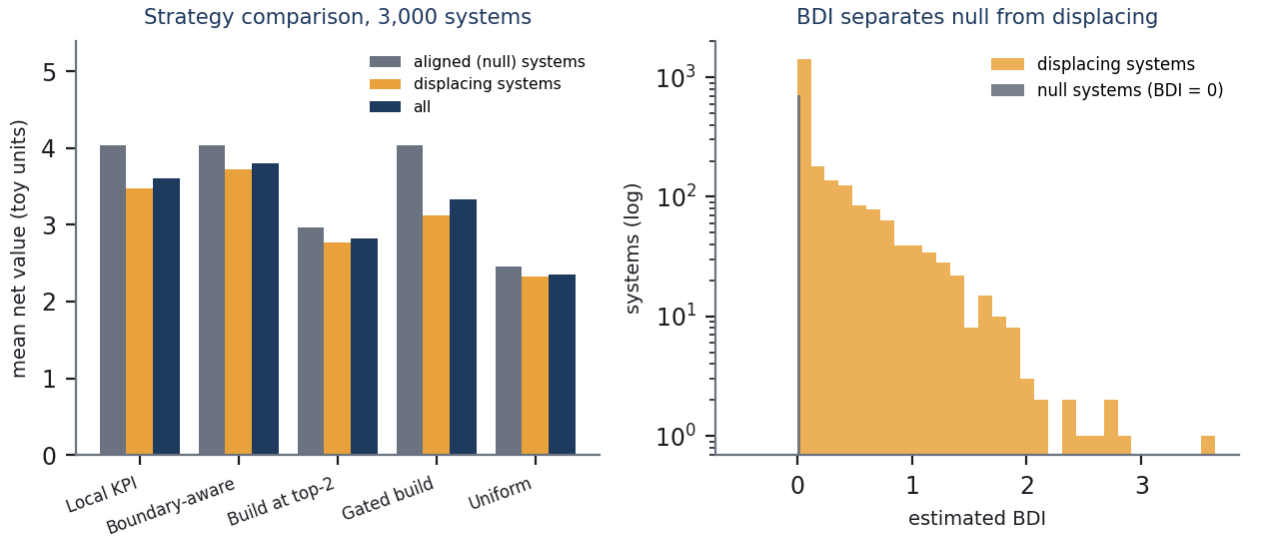

Figure 18. Experiment A. Left: mean net value by strategy, in null and displacing systems. Right: estimated BDI separates the two classes.

Table 15. Mean net value (toy units) by strategy. Higher is better.

Strategy	Null systems	Displacing systems	All
Local KPI	4.04	3.48	3.61
Boundary-aware	4.04	3.72	3.80
Build at top-2 carriers	2.96	2.77	2.82
Gated build	4.04	3.12	3.34
Uniform	2.45	2.32	2.35

- **BDI works as a gate, by construction.** In null systems the estimated BDI is exactly 0.0 in every case; in displacing systems its mean is 0.25, with 44% of displacing systems above the 0.05 tolerance. The remainder are displacing systems in which the local action happened to be nearly optimal anyway.
- **Boundary-aware re-selection beats the local KPI** in displacing systems (3.72 against 3.48) and ties it in null ones.
- **Building capacity loses.** At a cost of 0.45 per unit, building at the top-two carriers is worse than the local KPI on average (2.82 against 3.61), and it wins against the local action in 0% of displacing systems. The gated rule recovers some but not all of the loss.

A retained negative

In this toy, **cheap re-selection of the action beats costly construction**. This echoes the original's retained 250,000-case negative (Chapter 27), where routing-style semantics failed to dominate, and it sharpens it: construction is not free, and where the action set already contains a good consequential option, building is the wrong tool. The law's "construction" claim therefore has to be read as conditional on re-selection being unavailable, expensive or insufficient.

Experiment B: the information-parity 2×2

Test T15 requires separating representation effects from objective effects. The toy gives each decision-maker either coarse or detailed information about hidden downstream harm (the coarse arm sees only two group averages), and either the local or the consequential objective. 4,000 decision problems per cell.

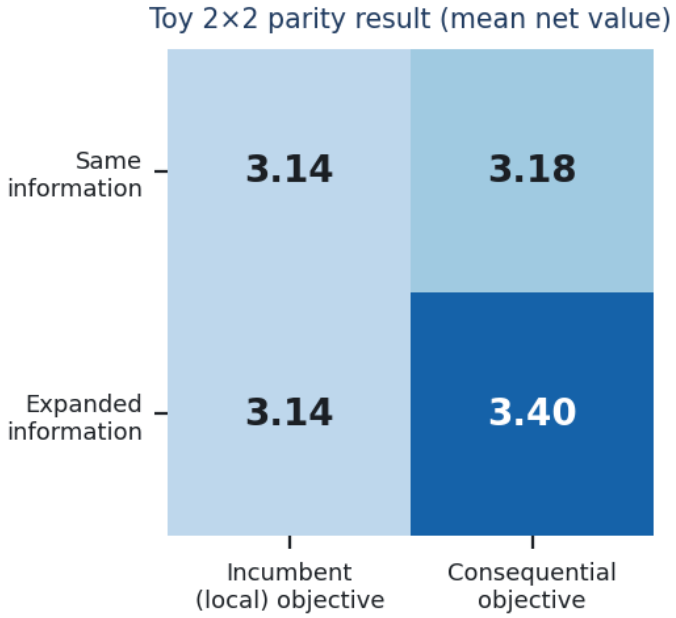

Figure 19. Experiment B. Mean net value in the information-parity 2×2. More information alone does nothing if the objective ignores it; the objective change alone helps little with coarse information; together they help most.

- Same information, local objective: 3.14. Same information, consequential objective: 3.18 (gain 0.05).
- Expanded information, local objective: 3.14 (no gain: the objective ignores the extra information).
- Expanded information, consequential objective: 3.40 (gain 0.26, standard errors under 0.01).

The pattern is a complementarity. Neither better information nor a wider objective helps much alone; the benefit appears when they are combined. This is a statement about the toy's construction, but it shows what T15 is designed to detect and why a head-to-head comparison that changes both at once can mislead about which one mattered.

Experiment C: when does construction pay?

Over a grid of burden scale (0.5 to 6) and construction cost (0.1 to 1.5 per unit), 400 random systems per cell compare building capacity against two baselines.

- Against the **fixed local action** (the phase diagram in Chapter 12, left panel), construction wins in 9 of 36 cells: all at a cost of 0.25 or below, with burden scale 1 or more at the lowest cost and scale 2 or more at 0.25 (margins at 0.25 are tiny, 0.01 to 0.10).
- Against **boundary-aware re-selection** (right panel), construction wins in 0 of 36 cells.
- The break-even is therefore a frontier: construction pays when burden is large, cheap capacity is available, and no cheaper re-selection exists.

What these experiments are for

They are not evidence for or against the law in the world. They are a demonstration of method: each hypothesis is stated, a falsifier is built into the design (null systems; parity cells; cost grid), and the unflattering results are kept. A reader who runs the released script can change any assumption and see how the conclusions move.

PART IV

Applications

Four places where the grammar meets money, machines, weather and markets, each stated with its own guardrails.

CHAPTER 22

From a Friction Economy to a Reconciliation Economy

If the law is right that unresolved state reappears as friction, then an economy can mistake friction for demand. Some revenue exists because a difficulty is real and someone solves it. Other revenue exists because an avoidable difficulty persists. The distinction is easy to state and rarely measured.

Three kinds of market

Table 16. The law does not call every intermediary waste; it asks whether friction is necessary, transparent and reducible.

Type	What earns the revenue	Example of the question to ask
Value-creating	New capability that did not exist	Does the product do something genuinely new?
Friction-reducing	A real coordination, information or risk problem is solved	Would the problem persist without this intermediary?
Friction-dependent	Revenue depends on avoidable friction continuing	Does income fall if the difficulty is removed?

Market formation is not value creation

Local profit π_{local} can rise with friction Φ while net reconciled value NRV_G falls. The law does not condemn intermediaries or regulation as such; it asks whether a lower-friction architecture can preserve safety and capability while increasing whole-system value.

Two proposed diagnostics

$$FDR = \text{revenue attributable to avoidable friction} / \text{total revenue} \qquad RD = AvoidedFriction + ReleasedCapacity + NewProductiveValue - TransitionCost - NewDisplacement - DeferredBurden$$

The Friction Dependency Ratio (FDR) and Reconciliation Dividend (RD) are proposed extensions for testing, not historically canonical Rufino equations. They operationalise the question: is the business earning because it creates capacity, because it removes a necessary difficulty, or because the difficulty remains?

Friction pools visible today (as cited in the source corpus)

Table 17. Friction pools. Figures are as reported in the author-supplied corpus (2026) and were not independently re-verified in this edition.

Pool	Independent evidence cited	Reading under the law
Food waste	UNEP: 1.05 billion tonnes wasted in 2022; economic cost above USD 1 trillion a year	A 15 to 50% recovery counterfactual implies USD 150 to 500 billion of gross avoided waste before transition costs
US health administration	CMS: USD 5.3T spending in 2024; administration about 25 to 31% of spending, about 82% of it billing and insurance related	Implied billing-and-insurance pool of roughly USD 1.09 to 1.35T; a 10 to 20% cut releases about USD 109 to 269B if quality and access hold
Remittances	World Bank: 6.36% average cost; cutting at least five points could save up to USD 16B a year	Transaction friction that can be monetised while raising household retained value; compliance and security costs remain real
Trade and borders	WTO: full Trade Facilitation Agreement could cut trade costs 14.3% and add up to USD 1T of trade a year	Reducing process friction can expand the market that previously monetised delay
Public-service burden	OECD 2026: only 10 of 36 members have standardised mechanisms to measure user-side transaction costs	A measurement gap: services can look efficient internally while exporting time and repeat contacts to citizens

A conservative partial counterfactual

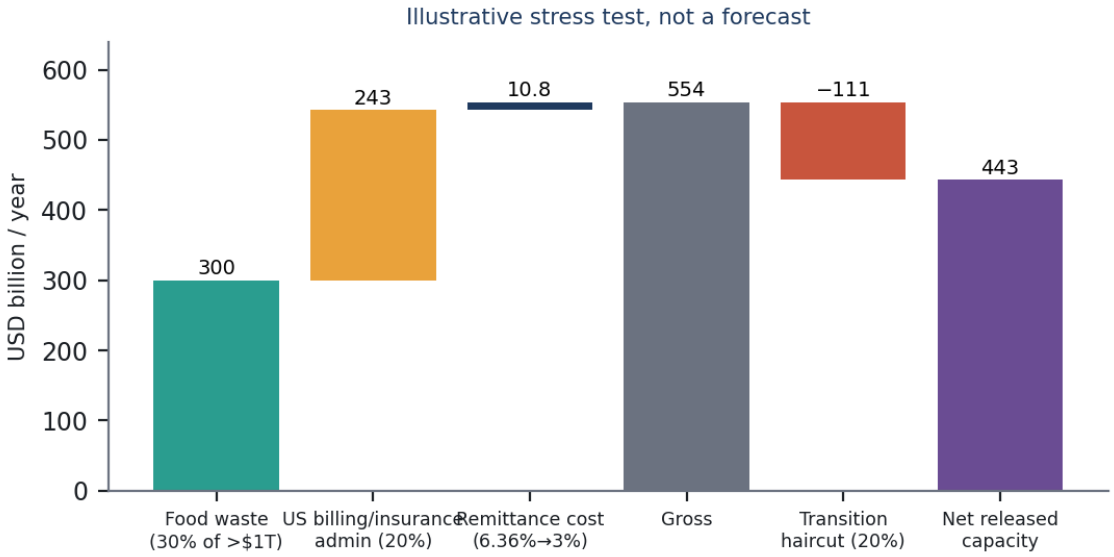

Figure 20. The source's illustrative stress test. Using only food waste, US billing and insurance administration, and remittance pricing, with a 20% transition haircut. A scenario, not a forecast; not additive with trade-volume effects.

The arithmetic: recover 30% of the food-waste cost (USD 300B), cut US billing-and-insurance burden by 20% using midpoint shares (about USD 243B), and move remittance costs from 6.36% toward the 3% target (about USD 10.8B on a linear reading of the World Bank relationship). Gross potential is about USD 554B a year; a 20% transition haircut leaves about USD 443B of modelled released capacity. The number is useful as a worked example of the NRV logic and should not be quoted as an estimate of anything.

The labour-carrier rule

A reconciliation economy cannot simply delete the jobs and firms attached to friction. Labour, capital, communities and tax bases are receiving carriers. If removing friction produces equal or greater unemployment, debt, regional decline or monopoly dependence, the intervention fails its own test. The sequence is: remove an avoidable function, identify the displaced labour and capital, build transition capacity, redeploy into productive work, retest.

Why transfer economies at all?

The proposed transition is not from markets to no markets. It is from an economy that can count avoidable friction as productive activity to one that preferentially earns by reducing schema gaps, lowering avoidable transaction burdens, constructing missing capacity and monetising the value released. It is justified only where measured NRV after transition is positive and no material carrier is made worse beyond declared tolerances.

CHAPTER 23

Auditing the AI Market

Artificial intelligence is the domain where the law is most immediately testable because the systems, the logs and the incentives are all digital. The book applies the ledger to the AI market as it stood in 2026.

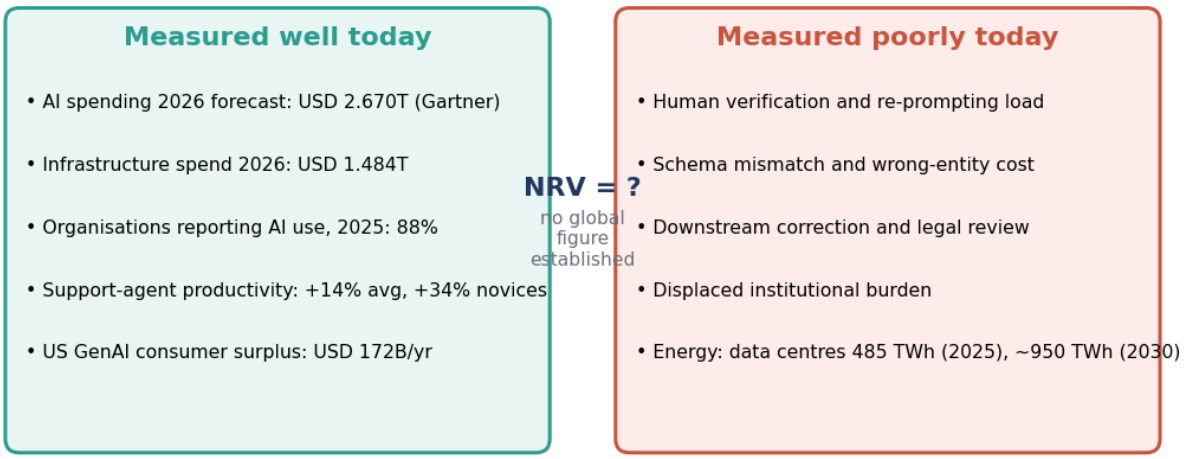

Figure 21. The AI ledger. Spending, adoption and infrastructure are measured well. Verification load, schema mismatch, downstream correction and displaced institutional burden are measured poorly. No credible global net reconciled value exists yet. Figures as cited in the source corpus.

The AI schema gap

$$G\sigma_{AI} = \delta(\, X^{*}_{world/task}\, ,\, \hat{X}_{model/workflow}\,) \qquad G\sigma_{AI} \to \Phi_{AI} \to H_{human} \to D_{downstream}$$

An AI system acts through learned representations, context windows, tool schemas, ontologies, prompts, reward functions and downstream institutional rules, never through reality directly. Schema mismatch surfaces as hallucination, stale context, wrong-entity resolution, reward misspecification and out-of-distribution failure. Verification, re-prompting, exception handling, fact-checking, legal review and fallback processes are hidden compensators: an automation rate can rise while human reconciliation load rises elsewhere.

AI net reconciled value

$$NRV_{AI} = V_{productivity} + V_{consumer} + V_{capability} + V_{knowledge} - C_{compute} - C_{energy} - C_{verification} - C_{errors} - C_{schema} - C_{downstream}$$

The market measures spending, investment, benchmark capability and adoption far better than aggregate verification load, schema mismatch and displaced institutional burden. The law's contribution is to make the missing ledger an explicit measurement requirement. The objective it implies is not maximum tokens or maximum automation but **useful capacity released per unit of total consequential cost**, which means a smaller system can beat a larger one if its total burden is lower for equal or better outcomes.

The agentic execution gate

Execution gate

A high-impact AI agent should not commit an action merely because its local objective improves. Before execution it should evaluate the consequential boundary, material carriers, post-action burden and the non-displacement constraints. For low-impact or BDI≈0 cases the gate should stay lightweight rather than becoming bureaucratic overhead.

A compliance checklist for any AI system

- Can it distinguish evidence-grounded state from the receiver's representation?
- Does it quantify or explicitly mark schema gaps instead of silently coercing incompatible states?
- Does it keep friction dimensions separate unless a conversion is declared?
- Does it distinguish schema-gap impact from boundary divergence?
- Can it report null or unknown instead of forcing a carrier or an accusation?
- Can it trace displacement by carrier, dimension, coupling and delay, and detect hidden compensation?
- Can it propose schema migration or capacity construction, not only redistribution?
- Does it retest Gσ, Φ, BDI, D, H, RVG, NRV and MU+ after intervention?
- Does it keep factual contradiction separate from inferred intent?

CHAPTER 24

PHOTOSYNTHESIS: A Live Prospective Climate Test

PHOTOSYNTHESIS is not a new theory. It is the climate-domain implementation of the same kernel: climate science supplies hazard forecasts and native variables, LERM traces where the burden will land, IAMF-P builds response capacity before the burden peaks, and the retest asks whether the solution merely moved cost into the grid, the water system, debt, emissions, wages or a neighbouring region.

$$\text{PHOTOSYNTHESIS} = K_R(\, M_{\text{ElNiño}}(\Omega)\,)$$

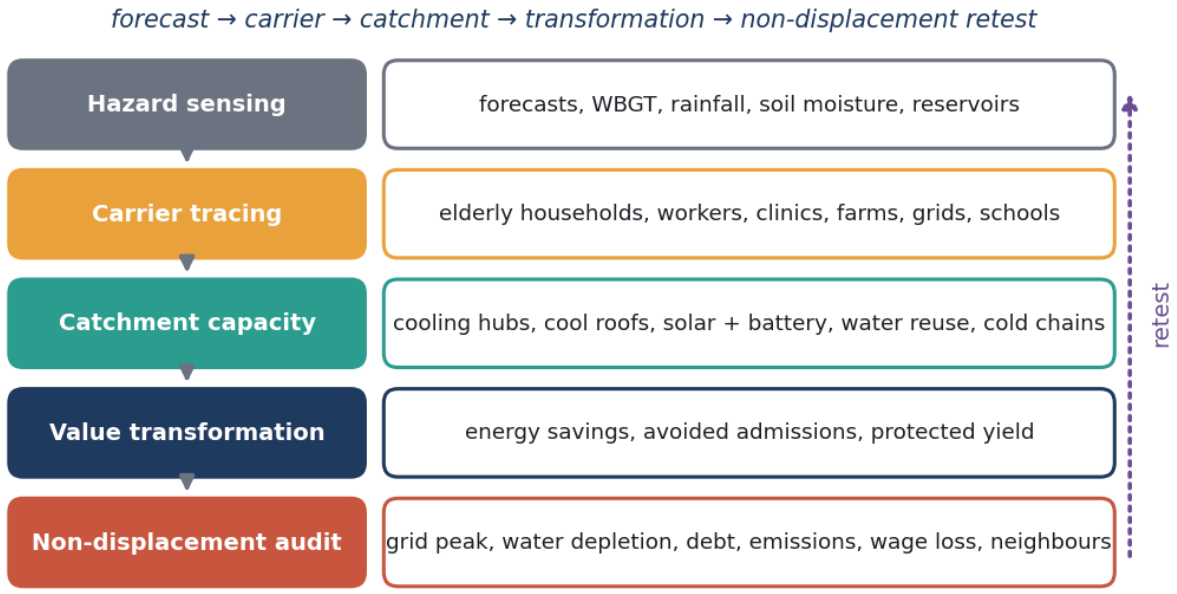

Figure 22. The five catchment layers of PHOTOSYNTHESIS, from hazard sensing to non-displacement audit, with a compulsory retest.

State map and hazard RVG

$$X_t = [T, P, H, \text{WBGT}, \text{soil}, \text{rivers}, \text{reservoirs}, \text{groundwater}, \text{grid}, \text{health}, \text{crops}, \text{food}, \text{income}, \text{population}]$$

$$\text{RVG}_{\text{hazard}} = \iota_{\text{hazard}} - \alpha_{\text{response}}$$

Why the timing is the opportunity

The source builds the protocol around the 2026 to 2027 El Niño window, using September 2026 NOAA and WMO forecasts and a mortality projection as the prospective frame. The research opportunity is temporal: the event is underway, but a large part of the forecast burden lies ahead. That allows a frozen kernel, pre-declared sites, baseline telemetry, matched controls, intervention before peak exposure and a post-event whole-system audit. This edition has not independently verified the forecasts; the protocol is the contribution.

First pilot logic: the Philippines

Table 18. Pilot nodes. The finance node is itself a carrier.

Node	What is measured	Example construction
Urban heat	Heat exposure, indoor temperatures	Cooling, shade, efficient buildings, distributed energy
School	Indoor thermal limits, learning continuity	Solar plus storage, ventilation, water
Health	Clinic power, cold chain, surge staffing	Backup power, cooling, communications
Agriculture-water	Soil moisture, yield, farmer income, groundwater	Irrigation scheduling, storage, groundwater limits
Food and logistics	Cold-chain uptime, spoilage, worker heat burden	Cold-chain resilience, supplier finance
Finance	Capex, opex, avoided cost, maintenance funding	Financing with no debt transfer to vulnerable households

Financing guardrails

$$EUL_s = \max(0, Profit_s - ExpectedProfit_s \mid \text{normal counterfactual}) \qquad F_s = \alpha_s \cdot EUL_s$$

The playbook proposes contractually redirecting a share of measurable event-linked upside toward prevention, while insisting on a distinction: a market beneficiary is not automatically a causal actor. Claims that any company or person financed, caused, prolonged or exploited deaths require transaction-level and causal evidence, and this book makes none.

Outcome metric and kill tests

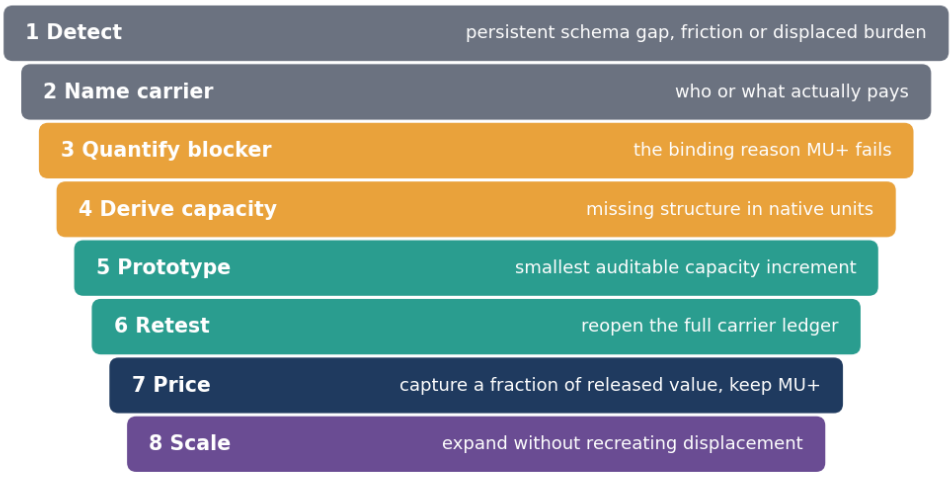
Treatment effect is the outcome under PHOTOSYNTHESIS minus the outcome under a matched counterfactual, with NRV kept vector-valued until auditable conversion functions exist. Mortality will likely be underpowered in a small pilot, so proximal and hierarchical endpoints sit beside it. Seven kill tests are specified in advance:

- No predictive or intervention value beyond a strong heat-health incumbent using the same consequential boundary.
- Carrier identification no better than simpler vulnerability or network methods on untouched holdouts.
- Heat exposure falls only by exporting equal or greater burden (electricity cost, water depletion, debt, emissions, wage loss, neighbouring stress).
- Positive-sum value disappears after lifecycle, maintenance, financing and replacement costs.
- The result depends on site-specific tuning and does not transfer when only M_d and the feasible set change.
- Event-linked profit cannot be separated from ordinary growth or commodity variation.
- The monitoring system repeatedly invents hidden carriers where the data cannot identify them.

CHAPTER 25

The Frontier Market Foundry and the Universal Package

A persistent unresolved burden is, in economic terms, a cost someone is already paying. The Frontier Market Foundry converts that observation into a disciplined path from finding to company, with gates that stop the process whenever the ledger fails.



Carrier discovery comes before market discovery. Commercial gates start only after a costly blocker and a feasible build exist.

Figure 23. The eight gates from detection to scale. Carrier discovery precedes market discovery.

$$B_j = Loss_j + FrictionCost_j + CompensationCost_j + DeferredCost_j \qquad RecoverableValue_j = q_j \cdot B_j \qquad TAM^*_j \approx N_j \cdot \min(WTP_j, AvoidedBurden_j + ReleasedValue_j)$$

The asterisk matters. TAM* is a bottom-up consequential opportunity estimate anchored in a carrier already paying an unresolved cost, not a top-down market size. A venture qualifies only if the carrier ledger survives adversarial accounting: value cannot be created merely by moving the burden to a weaker actor, a later time, the environment, an unpaid worker or an unmeasured public system.

Market modes, including informal and illicit systems

The ontology includes private markets, public systems, commons, informal exchange, virtual economies and illicit markets, because displaced value and unmet demand can exist in all of them. Inclusion is analytical, not facilitative. For illicit markets the constructive target is lawful substitution, prevention, provenance, treatment and rehabilitation, victim support and anti-fraud, and this book provides no operational assistance for crime or evasion. Commercial success is never presumed: adoption, regulation, legality, ethics, capital intensity, competition, willingness to pay and execution remain separate gates.

Productisation: RSO as an operating layer

Table 19. RSO does not replace existing systems; it sits above them.

Existing capability	Role under RSO
Weather forecast	Input telemetry
Digital twin / ontology	State representation and relationships

Existing capability	Role under RSO
Causal model	Counterfactual and coupling estimation
Portfolio risk engine	Financial burden telemetry
Process mining	Event and object flow telemetry
AI model or agent	Prediction and search capacity
Hospital information system	Clinical telemetry
RSO itself	Consequential objective, carrier ledger, construction search, non-displacement audit

The Rufino Universal Interface Package (RUIP)

Table 20. The ten components of the proposed package. A specification, not a claim that platforms already support it.

Component	Required content
01 Canonical law spec	Versioned equations, symbol dictionary, invariants, stopping rules, null cases, prohibited shortcuts
02 Schema contract	Accepted state variables, constraints, exclusions, translation operators, provenance, blind spots
03 Domain adapter	M_d, native units, observation model, causal graph, horizons, feasible interventions, uncertainty
04 Claim / provenance ledger	Claim to evidence to source to transformation to uncertainty; intent kept separate
05 Friction ledger	Information, time, money, energy, labour, biological, social, trust friction vectors
06 Carrier / coupling ledger	Carriers, couplings, dimensions, delays, hidden compensators, uncertainty
07 IAMF-P action library	Schema migration, capacity construction, routing, transformation, reintegration, redundancy, governance
08 Non-displacement retest	Post-state Gσ, Φ, BDI, D, H, RVG, NRV, worst-carrier burden
09 Eval suite	Positive, null, adversarial, holdout, transfer and parity-ablation cases
10 Version / provenance layer	Immutable releases, hashes, DOI or repository references, attribution, change log, failed tests

Deployment modes

Table 21. Deployment modes for AI systems.

Layer	For AI systems
Prompt / policy	Encode the invariant questions and stopping rules without claiming weights changed
Retrieval	Attach corpus, formulas, adapters and claim ledger with provenance
Ontology / schema	Expose state objects through JSON Schema, SQL or graph schemas, typed APIs
Evaluation	Score schema fidelity, boundary expansion, carrier identification, unit discipline, retest and refusal to invent hidden states
Agent / control	Pre-action ledger and post-action retest before acceptance

Table 22. Deployment beyond AI.

System family	Deployment
Databases / software	Schema migration, validation, interoperability, data-contract audits
Healthcare	Patient-state schema, recognition gap, caregiver and future burden, network retest
Finance	Risk-state schema, counterparty network boundary, fee and documentation friction
Government	Citizen need versus administrative schema, document burden, user-side transaction cost
Education	Capability versus credential schema, translation friction, outcome retest
Supply chains	Demand and inventory schema divergence, multi-tier carrier tracing
Energy / physical control	Sensor state versus control model, grid boundary and rebound, storage capacity
Research / science	Claim schema, measurement provenance, explicit unknown state

PART V

Testing the Law

Prior art, retained simulations, falsifiers, the claim ledger and a roadmap. The part of the book that decides whether the rest was worth reading.

CHAPTER 26

Prior Art and the Novelty Question

The correct priority question is not whether externalities, feedback, entropy, causal graphs, resilience or burden shifting existed before. They did. The question is whether any earlier framework requires the complete sequence as one domain-independent recurrent operator.

boundary divergence → counterfactual displacement → carrier → hidden compensation → capacity construction → productive reintegration → non-displacement retest

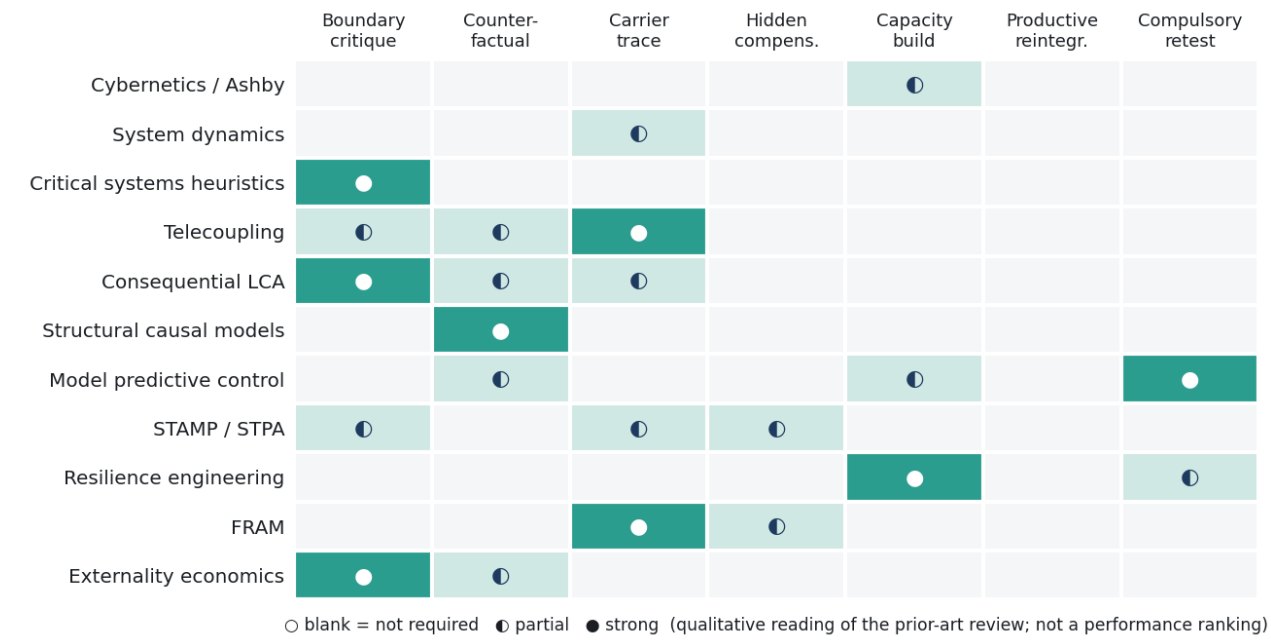


Figure 24. Qualitative reading of the prior-art review. Each family covers part of the sequence; none, in the reviewed set, requires all seven steps. This is a coverage map, not a performance ranking or proof of historical priority.

Table 23. Prior-art collision table (from the source review).

Framework family	Already contains	Closest collision	Missing relative to the full operator
Cybernetics / Ashby	Feedback, regulation, requisite variety	General cross-domain regulation	No mandatory consequential carrier ledger or non-displacement audit
System dynamics	Stocks, flows, delays, policy resistance	Delayed consequences	No requirement to assign omitted consequence to a carrier and build capacity there
Critical systems heuristics	Boundary critique; involved versus affected	Strong conceptual predecessor of S versus G	Reflective and participatory rather than a quantitative operator
Telecoupling	Sending, receiving, spillover systems	Closest displacement and carrier predecessor	No mandated hidden-compensation, construction, reintegration or retest
Consequential LCA	Expanded boundaries; burden shifting	Strong predecessor to the consequential boundary	Accounting family rather than a recurrent constructive controller
Structural causal models	Counterfactual interventions	Mathematical predecessor of D	No requirement of catchment, reconciliation or no-hidden-loser retest
Model predictive control	Predict, optimise, act, observe, repeat	Closest recurrence predecessor	Optimises the boundary it is given; does not discover omitted carriers
STAMP / STPA	Losses, hazards, control structures	Closest engineering-safety analogue	Safety focus; no general displacement tensor or productive transformation
Resilience engineering	Respond, monitor, anticipate, learn	Adaptation predecessor	No carrier-specific displacement accounting
FRAM	Functional coupling and variability	Coupling and socio-technical analogue	Not the full boundary-carrier-construction-retest algebra

Framework family	Already contains	Closest collision	Missing relative to the full operator
Externality economics	Private versus social cost	Direct ancestor of boundary cost	Starts after the externality is specified

Defensible priority statement

In the major adjacent framework families reviewed, no complete predecessor was located that requires the full Rufino sequence as one domain-independent recurrent operator. This is a positive novelty-search result, not an absolute historical proof that no equivalent formulation exists. A systematic literature review would be needed to say more.

This edition adds one observation from its own reading. The novelty, if it survives, lies in the *conjunction and the acceptance rule*, not in any single element. That is also the claim easiest to test, because a rival framework can be given the same information and action budget and asked to match the full sequence.

CHAPTER 27

Retained Simulations and Negative Results

The original book keeps its failures in plain view, and the discipline is worth preserving. Three simulation results are carried over, each flagged with the reproducibility limits the source itself states.

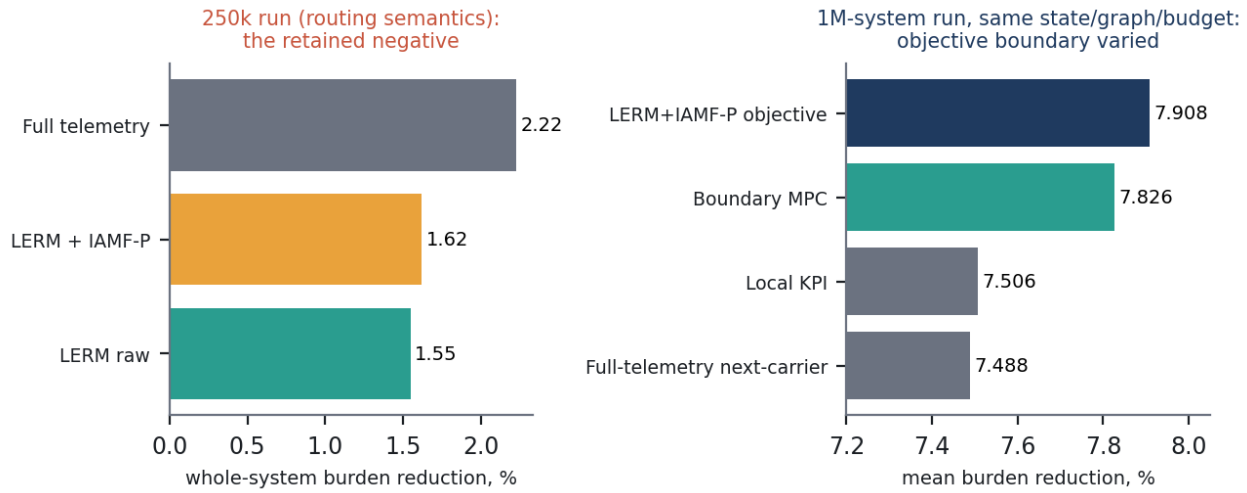

Figure 25. Source-reported simulation results. Left: the 250,000-case run in which routing-only semantics failed to dominate. Right: the 1,000,000-system run with the objective boundary varied. As reported in the author-supplied corpus.

The 250,000-case negative ablation

When intervention semantics merely routed effort through the receiving carrier's existing absorption capacity, the LERM/IAMF-P hybrid did not dominate. Full telemetry achieved 2.224283% whole-system burden reduction against 1.618167% for LERM/IAMF-P and 1.546338% for raw LERM. That falsified the lazy proposition that anything labelled LERM wins. The supplied artifact contains aggregate outcomes only, so this negative is directly represented but the case-level data are not.

The corrected catch-basin run

Table 24. Corrected catch-basin semantics (build capacity at the predicted loss carrier).

Architecture	Reported burden reduction
LERM + IAMF-P	5.6696%
LERM raw	5.6585%
Full-telemetry predictor	5.5567%
Graph / digital twin	5.1219%
Uniform allocation	4.8551%

The relative advantage over full telemetry was about 2.03%. Because intervention semantics were changed after observing the earlier failure, the source itself classes this as exploratory rather than confirmatory, and the 5.6696% figure is document-reported and not rerunnable from the aggregate CSV.

The two 1,000,000-system experiments

The first froze a generic universal heuristic across 20 domain parameterisations. It won only 1 of 20 domains and averaged 7.136% burden reduction against 7.567% for the strongest local-KPI strategy. That falsified the wrong definition of universality, the same flat action everywhere. The second held state, graph, dynamics and budget constant while changing only the objective boundary: the whole-system objective averaged 7.9083% against 7.8256% for boundary MPC, 7.506% for local KPI and 7.488% for a full-telemetry next-carrier strategy, about a 1.06% average relative gain, while winning only about 29% of individual cases.

> **The sentence to remember**
>
> **Universality is not the same action everywhere. Universality is the same consequential grammar everywhere.** Winning only 29% of cases while improving the aggregate is exactly the BDI story: the operator should activate when boundary divergence matters and otherwise stay quiet.

The constructive-closure test

A fresh 10,000-case test generated for the original edition (seed 20261004; six carriers per case; MU+ threshold 0.02) started with a 10.00% strict pass rate. A recursive procedure repeatedly found the worst carrier, added targeted capacity to clear its gap plus a buffer, applied bounded stochastic spillovers and reopened the ledger. After this, 100.00% of cases passed, with a mean of 2.30 structures added (median 2; 90th percentile 4; maximum 6), and the mean worst-carrier margin moved from −0.0479 to +0.0348.

Table 25. What 100% means in the constructive-closure test.

It means	It does not mean
Within the modelled feasible set, every material carrier cleared a positive threshold after recursive construction	Every real system has a costless feasible construction
Failure percentages can be converted into blocker classes and engineering requirements	A harmful or illegal intervention is permitted because it improves a metric
A moving bottleneck is expected and is part of the recurrence	The first intervention should be declared a success because an average improved
The ledger must stay carrier-specific	Unlike units may be silently added into one score

Weak dominance under feasible-set inclusion

$$\text{if } \Sigma_I \subseteq \Sigma_R \text{ and } A_I \subseteq A_R \text{ then } J_R^* \leq J_I^* \text{ for the same consequential objective}$$

This is a formal statement: an implementation that can emulate every incumbent representation and action, and adds relevant information or capacity, can do no worse and may do strictly better. It is a feasible-set result, not a promise of practical superiority. Real superiority still needs information parity, equal budgets, safety constraints, untouched holdouts and independent replication. Experiment B in Chapter 21 is a small demonstration of why.

Conformance is not validation

The 121 conformance tests (Appendix C) check that the document preserves its required content. They are software and document checks. The 250k, catch-basin and 1M results are simulation evidence, which earns scientific weight only to the degree the generator, seeds, case-level results, intervention semantics and code are released. A publication-grade package should release all of them.

CHAPTER 28

Falsification and Decisive Experiments

A law worth keeping has to be able to lose. The original specifies seven ways the universal claim could fail.

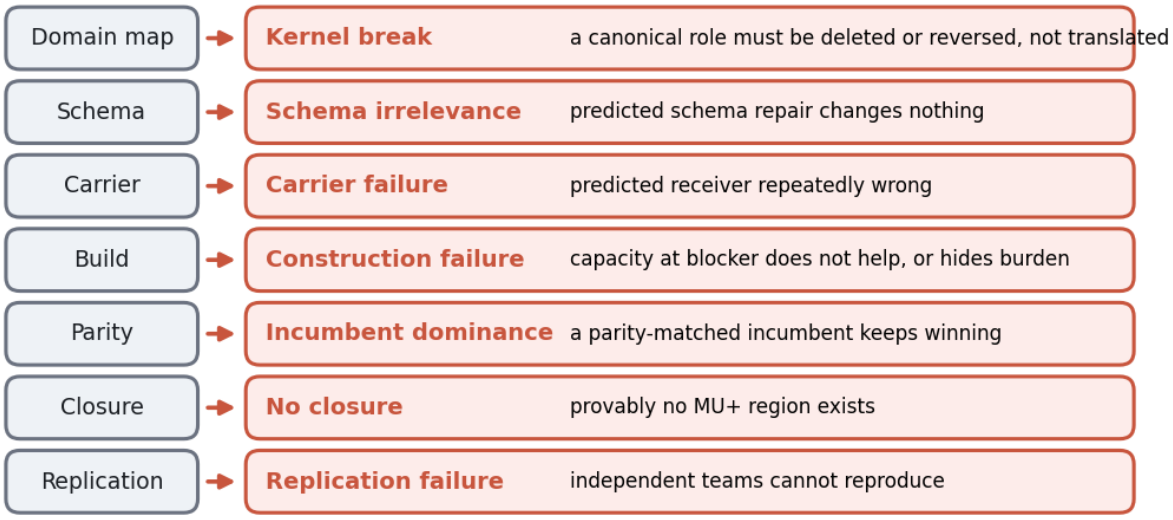

Figure 26. The seven falsifiers of the universal claim, each tied to the stage of the kernel it would break.

The decisive multi-domain experiment

The decisive test freezes K_R and each domain adapter, preregisters endpoints and carrier-prediction rules, and runs on untouched systems against the strongest relevant incumbent. Its elements are the information-parity factorial design, null-boundary controls chosen in advance, sealed outcome reveal and independent replication.

Table 26. The information-parity factorial design (T15). Cell D must beat both B and C to support the kernel.

Cell	Information	Objective	What it isolates
A	Same as incumbent	Incumbent	Baseline
B	Same as incumbent	Rufino consequential	Pure objective effect
C	Expanded consequential	Incumbent	Pure information effect
D	Expanded consequential	Rufino consequential	Joint effect; the claimed advantage

Prospective validation standard

- Freeze the kernel version, adapter, endpoints, carrier-prediction rule and materiality thresholds before outcomes are seen.
- Include null and positive-spillover cases selected in advance.
- Match incumbent information, action set, safety constraints and budget.
- Report all results, including failures and UNKNOWN outputs.
- Hand data and code to unaffiliated replicators.

Near-term test programme

Table 27. Near-term test programme from the source roadmap.

Arena	Next decisive test
Climate	Freeze PHOTOSYNTHESIS kernel and site rules; measure the 2026 to 2027 El Niño outcomes prospectively
Water	Use basin datasets to test carrier prediction and interventions against standard water accounting
Healthcare	Use discharge and caregiver data or a prospective service redesign; compare whole-patient and network outcomes
Grid	Use demand-response data with rebound and comfort metrics; compare local dispatch with consequential control
Finance	Use supervisory or public stress datasets; compare carrier identification and systemic-loss reduction
Supply chain	Use multi-tier event and inventory data; test supplier and future-stockout burden
AI	Use matched agent workflows; measure human review minutes and error cost under parity

CHAPTER 29

The Claim Ledger and Present Status

This chapter is the book's bottom line. Each claim carries a status and a reason, and no status is inferred from the title.

Table 28. The present claim ledger.

Claim	Status	Reason
Empirical origin in a real operating and life record	SUPPORTED AT SOURCE-CORPUS LEVEL	Equations followed repeated observation and operation
Coherent recurrent LERM + IAMF-P kernel	SUPPORTED	Canonical mathematics and playbooks share one trace, build and retest architecture
Cross-domain structural invariance	AUTHOR-SUPPORTED MAPPING; KERNEL TEST OPEN	Many domains document constituent phenomena; inter-rater mapping, null controls, sealed carrier prediction and parity tests remain incomplete
Empirical systems-law status	PROPOSED LAW / RESEARCH PROGRAMME	Coherent versioned specification with documented origin; prospective validation and replication still necessary
Complete historical firstness	POSITIVE NOVELTY SEARCH, NOT ABSOLUTE PROOF	No complete predecessor in the reviewed families; a systematic review is needed for more
Prospective predictive superiority of RSO	KERNEL TEST OPEN	Must be shown against the strongest incumbent with matched information, objective, action set, safety constraints and budget
A validated universal physical law of nature	NOT ESTABLISHED	No new fundamental interaction, constant or field law has been externally demonstrated
Solutions to Millennium Prize problems	NOT ESTABLISHED	Pure mathematics needs theorem-level proof and independent formal verification
Clinical cures (cancer, Parkinson's, ageing, mental illness)	NOT ESTABLISHED	Branch mappings are research adapters, not clinical proof or treatment recommendations
A deterministic global forecasting engine	NOT ESTABLISHED	The law can wrap forecasts and trace consequences; it does not replace domain forecasting science
PHOTOSYNTHESIS universal success	PROSPECTIVE	Testable now; success must be measured, not presumed

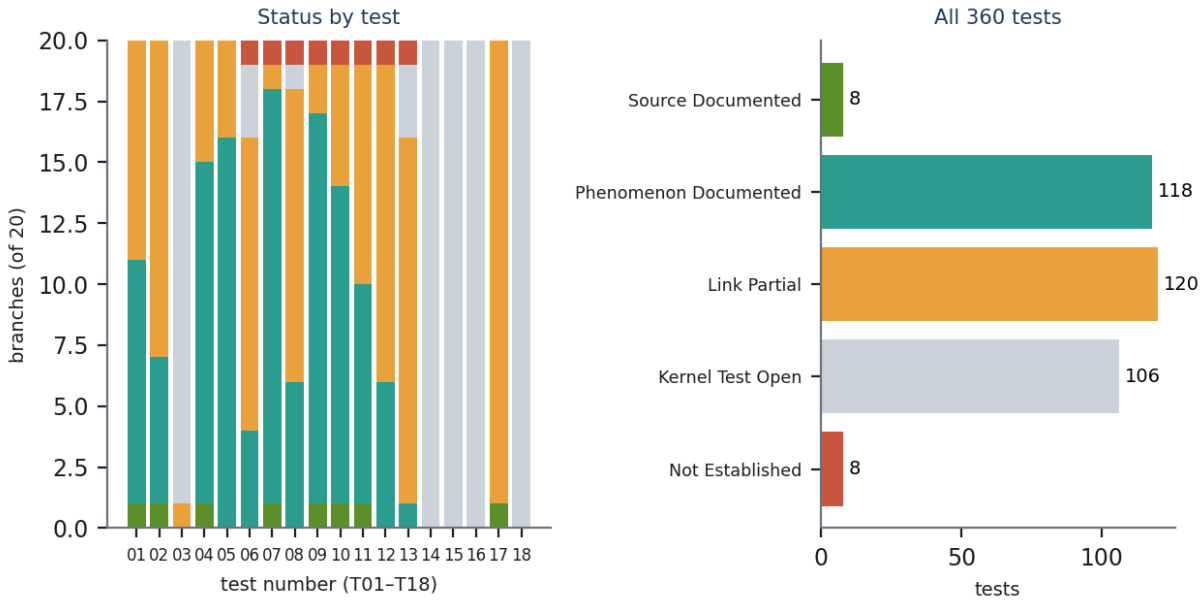

Figure 27. Status of all 360 registered tests (Part VI): by test number and in total. The sparse columns are the research programme.

The counts are sobering and informative. Of 360 tests, 8 are source documented, 118 are phenomenon documented, 120 are link partial or pending, 106 are kernel-test open and 8 are not established. The universal acceptance tests (T14 Mutual uptick, T15 parity, T16 untouched holdout) and independent replication (T18) are open in essentially every branch. That is the honest state of the programme, and it is why the status is "proposed law", not "established law".

CHAPTER 30

Roadmap and Provenance

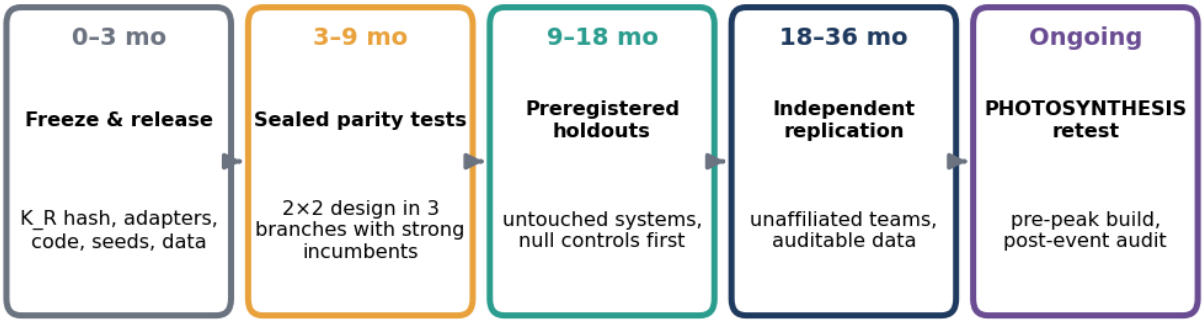

Figure 28. A proposed five-phase sequence. Dates are planning assumptions, not commitments.

Publication sequence in the source

Table 29. Planned publications.

Item	Content
Paper 1: Formal methods	BDI, displacement field, hidden compensation, RVG, IAMF-P search, unit discipline, identifiability, stopping conditions, API contract
Paper 2: Origin and operating case	Origin record, evidence hierarchy, compensatory centralisation, eight-node system, operating baseline, founder-to-institution protocol
Paper 3: Prospective benchmark	Preregistered cross-domain tests against best-in-class incumbents with holdouts and replication
Paper 4: PHOTOSYNTHESIS	Prospective climate application with matched sites, whole-system telemetry, lifecycle economics, non-displacement audit
Software specification	Open or controlled reference implementation of RSO and the adapter interface with provenance tracking

Priority and provenance practices

- Freeze a dated canonical manuscript and formula vault; keep cryptographic hashes of sources, code and data.
- Register a DOI for citable research objects; use versioned repositories and immutable release tags.
- Preserve author attribution in every derivative benchmark and implementation.
- Publish negative results and changes in semantics rather than silently rewriting history.
- Maintain a claim ledger distinguishing source claim, AI extraction, AI inference, independent evidence and unresolved question.

Closing statement

The law in one sentence

When a consequentially acting system operates through an incomplete representation or an undersized boundary, unresolved state reappears as friction, compensation, deferred burden or displacement into identifiable carriers. Reconciliation consists of repairing the representation, tracing the carrier, constructing the missing capacity at the binding blocker and recursively retesting until every material carrier achieves a preregistered positive consequential gain.

The book does not end at diagnosis. Its unit of progress is construction: a failed Mutual-Uptick ledger becomes a specification for missing infrastructure, and a persistent, economically material missing infrastructure becomes a candidate frontier market. This edition adds only one request of its own. Run the tests. The law will be worth exactly what it earns there, and a result that says NO ACTIVATION, UNKNOWN or NO FEASIBLE MU+ will be as welcome as one that says PASS.

PART VI

The Validation Atlas

Twenty branches, one 18-test battery, 360 named tests. An audit register, not a scoreboard.

VALIDATION ATLAS

The Universal 18-Test Battery

The register applies the same eighteen tests to Index Case 001, eighteen domain branches (B01 to B18) and one external holdout (H01), giving 20 × 18 = 360 named tests. The semantics of each test are fixed; only the domain's native variables, units, observables and feasible actions change. A test is never described as "passed" merely because a familiar local-versus-system phenomenon exists in the literature.

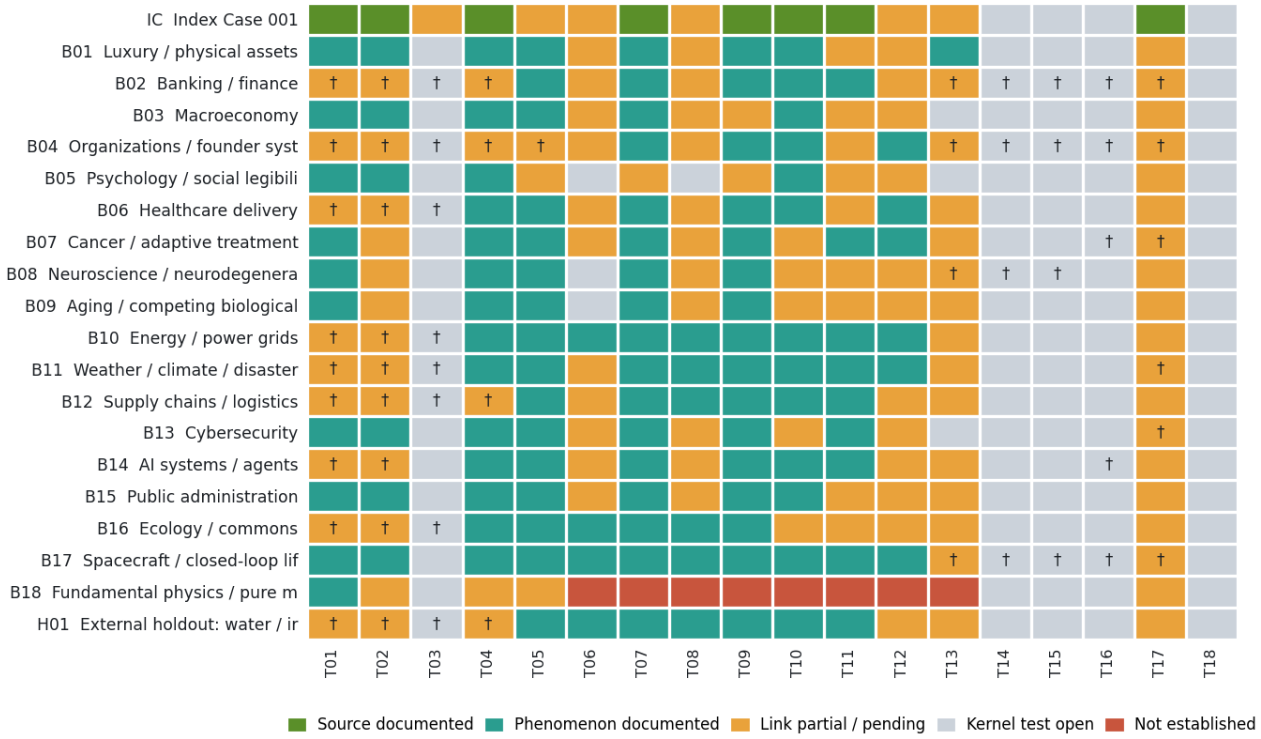

Figure 29. The full 360-test status map. Rows are branches, columns are tests T01 to T18. A dagger (†) marks cells whose status could not be recovered from the source and was assigned by this edition's conservative default rubric.

How to read a branch page

- **Branch card.** Native state X*, receiver schema, local boundary S, consequential boundary G, displaced state D, candidate carriers C, the IAMF-P capacity action and the current evidence statement. Text is the author's, condensed.
- **Test table.** For each of T01 to T18: the branch-specific operationalisation, the status in the evidence grammar and, where the source gives one, the branch-specific evidence note.
- **Daggers.** A † after a status means the status was not recoverable and the default rubric below was applied. 54 of 360 cells carry a dagger.

Default rubric used for daggered cells

T01, T02, T04 to T13 and T17 default to LINK PARTIAL; T03, T14, T15, T16 and T18 default to KERNEL TEST OPEN. The rubric is deliberately conservative: it never awards a stronger status than the source gave for the same test in comparable branches. Readers should treat daggered cells as placeholders to be confirmed against the author's master register.

The battery

Table 30. The universal 18-test validity battery.

ID / test	What is executed	Falsifier
T01 State fidelity	Reconstruct the evidence-grounded state X* using only records available before the outcome is revealed.	Fails if reconstruction needs post-outcome leakage or cannot keep provenance and uncertainty.
T02 Schema-gap measurement	Specify the receiver schema Σ and quantify the mismatch Gσ between X* and the recognised state X̌.	Fails if the gap cannot be operationalised independently of the outcome.
T03 Schema-causality intervention	Change the representation or translation layer while holding material resources as fixed as feasible.	Fails if narrowing Gσ does not improve consequential action, or merely relocates the burden.
T04 Friction vector	Measure avoidable information, time, money, energy, labour, biological or trust cost in native units.	Fails if friction is rhetorical, or needs invalid cross-unit summation.
T05 Boundary divergence	Compare the optimum inside the local boundary S with the optimum inside the consequential boundary G.	Fails if the divergence vanishes under a correctly specified whole-system objective.
T06 Null-boundary control	Include cases chosen in advance where BDI is about zero or spillovers are positive.	Fails if the operator invents displacement in aligned or null systems.
T07 Directed displacement	Estimate $D_a(j,k,\tau)$ against a declared counterfactual comparator.	Fails if burden movement cannot be told apart from baseline noise or confounding.
T08 Prospective carrier prediction	Name the receiving carrier C* before the outcome is revealed.	Fails if prediction is no better than strong causal or network baselines, or chance.
T09 Coupling-path identification	Identify the mechanism Γ by which state moves between nodes, categories, places or times.	Fails if the proposed coupling is post hoc and not causally supported.
T10 Hidden compensation	Test whether visible stability depends on an unpriced or unrecognised compensating node H.	Fails if removing the proposed compensator leaves performance structurally unchanged.
T11 Reconciliation Velocity Gap	Track burden inflow against realised absorption through time and test whether RVG anticipates accumulation or failure.	Fails if RVG tracks impending failure no better than native time-series baselines.
T12 Capacity construction	Build or activate capacity at the predicted bottleneck C* and compare with routing or redistribution alone.	Fails if carrier-targeted capacity does not improve consequential outcomes.
T13 Productive transformation	Where domain-valid, convert recoverable displaced state into higher-value state D′ without hidden loss.	Fails if claimed value creation depends on externalised or deferred burden.
T14 Mutual uptick	Require every material carrier to exit with positive, preregistered consequential gain, not merely non-worsening.	Fails if any material carrier is sacrificed, depleted or made dependent so the aggregate looks positive.
T15 Incumbent information parity	Run same-information and expanded-information factorial comparisons against the strongest relevant incumbent.	Fails if the advantage disappears when information and intervention budgets are matched.
T16 Untouched holdout	Freeze kernel and adapter before testing a second, untouched dataset or system.	Fails if performance depends on tuning after seeing holdout outcomes.
T17 Sensitivity and identifiability	Stress uncertainty, alternative causal histories, units, materiality thresholds and parameters.	Fails if the conclusion is brittle or hidden state is not identifiable from observation.
T18 Independent replication	Have unaffiliated operators reproduce or falsify the test from auditable data and code.	Fails if results depend on originator-specific interpretation or unavailable procedures.

Where the tests are strongest and weakest

Reading down the columns of the status map, tests T01 to T02 and T04 to T10, which concern state, schema, friction, boundary, displacement and hidden compensation, are mostly documented at the phenomenon level. T11 to T13, concerning RVG, construction and transformation, are mostly link-partial. T14 (Mutual uptick), T15 (parity), T16 (holdout) and T18 (replication) are open almost everywhere.

VALIDATION ATLAS

Executed Computational and Conformance Tests

Three kinds of computational work sit alongside the register. They are described in Chapter 27 and listed here for completeness, with the status each earns.

Table 31. Computational items and the status each earns.

Item	What it is	Status it earns
121-test conformance harness	Document and software checks: 121 document and software checks, all passing (Appendix C)	CONFORMANCE: not scientific validation
250,000-case negative ablation	Routing-only semantics failed to dominate full telemetry	SIMULATION: aggregate confirmed, case-level data not supplied
Corrected catch-basin run	Capacity built at the predicted carrier; 5.6696% reduction reported	SIMULATION: exploratory, semantics changed after a failure
Two 1,000,000-system experiments	First falsified a flat universal action; second supported a whole-system objective	SIMULATION: aggregates reported; raw data incomplete
Constructive-closure test	10,000 cases, recursive targeted construction, 100% closure in the model	FORMAL / COMPUTATIONAL: under stated feasibility assumptions
This edition's toy experiments	Seven small seeded simulations (Chapters 16 to 21)	ILLUSTRATIVE: method demonstrations only

VALIDATION ATLAS

Cross-Branch Synthesis

Before the individual branch pages, a view of the whole register at once. Each bar is one branch; each segment is the number of its 18 tests in a given evidence status.

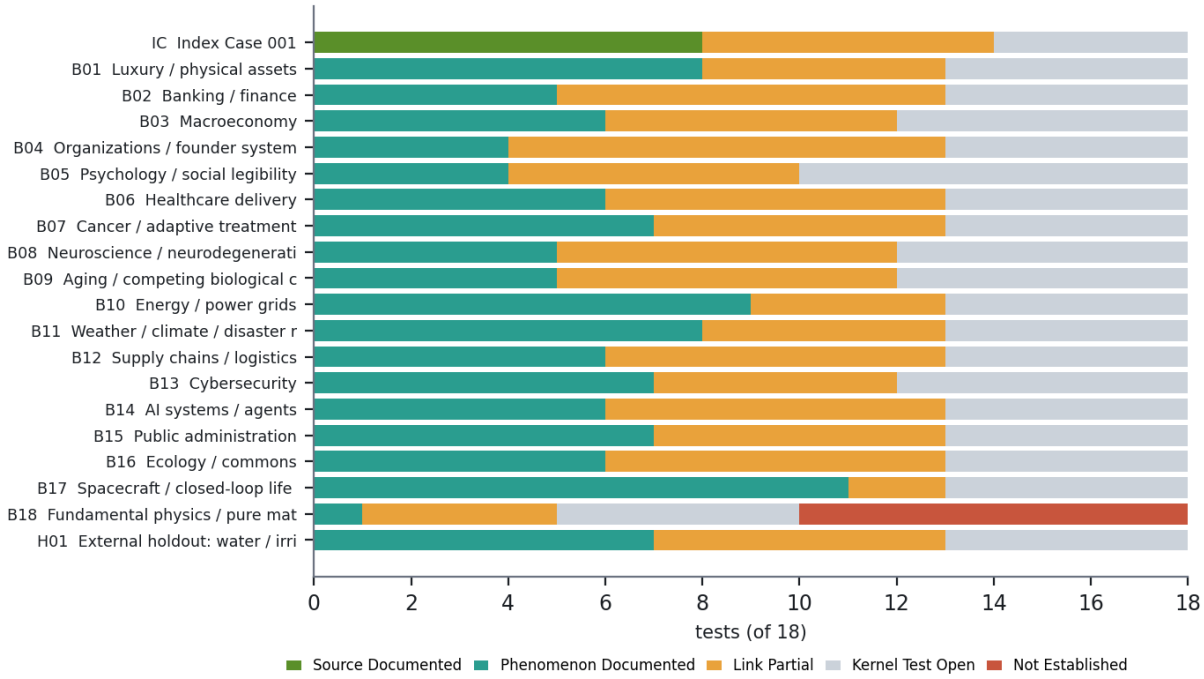

Figure 30. Status profile of each branch. Branches with long teal segments have the strongest independent phenomenon evidence; branches dominated by grey have the most work still to do.

Table 32. Status counts per branch (18 tests each).

Branch	Source	Phenom.	Partial	Open	Not est.	Daggers
IC Index Case 001	8	0	6	4	0	0
B01 Luxury / physical assets	0	8	5	5	0	0
B02 Banking / finance	0	5	8	5	0	9
B03 Macroeconomy	0	6	6	6	0	0
B04 Organizations / founder systems	0	4	9	5	0	10
B05 Psychology / social legibility	0	4	6	8	0	0
B06 Healthcare delivery	0	6	7	5	0	3
B07 Cancer / adaptive treatment	0	7	6	5	0	2
B08 Neuroscience / neurodegeneration	0	5	7	6	0	3
B09 Aging / competing biological constraints	0	5	7	6	0	0
B10 Energy / power grids	0	9	4	5	0	3
B11 Weather / climate / disaster response	0	8	5	5	0	4
B12 Supply chains / logistics	0	6	7	5	0	4
B13 Cybersecurity	0	7	5	6	0	1
B14 AI systems / agents	0	6	7	5	0	3
B15 Public administration	0	7	6	5	0	0
B16 Ecology / commons	0	6	7	5	0	3
B17 Spacecraft / closed-loop life support	0	11	2	5	0	5
B18 Fundamental physics / pure mathematics	0	1	4	5	8	0
H01 External holdout: water / irrigation	0	7	6	5	0	4

Three patterns across the register

- **Documented phenomena cluster in the diagnostic tests.** State, schema, friction, boundary divergence, displacement and hidden compensation are documented at the phenomenon level in many branches. These are the tests where independent literature already speaks the law's language.
- **Construction and acceptance are where the gaps are.** Productive transformation, mutual uptick, parity, holdout and replication carry most of the open and partial statuses. The register thereby locates the research programme: not in re-describing displacement, but in showing that capacity built at the binding carrier beats a fair incumbent.
- **The branches that look strongest are the ones with existing engineering practice.** Closed-loop life support, grids and water already practise capture, buffering and reprocessing, which is why their construction tests are closer to documented. That is evidence of fit, not of the kernel's superiority.

A caution against over-reading: counts of statuses are not scores. A branch with many documented phenomena can still fail the parity test, and a branch with many open tests may simply be young. The register is for deciding what to test next.

BRANCH IC · tests IC-T01 to IC-T18

Index Case 001

Current branch classification: SOURCE-RICH / EXTERNAL REPLICATION OPEN

IAMF-P build: Schema repair, provenance architecture, delegation, institutional scaffolding, reciprocal safety, governed stewardship.

Editor's reading. The index case is the only branch where the discovery record, not the literature, supplies the evidence, which makes it simultaneously the richest and the least independent. **Status profile:** 8 source documented, 0 phenomenon documented, 6 link partial, 4 kernel test open, 0 not established. Its weakest point is independence: every source is author-adjacent. The first test I would fund is a blind re-reading of the record by two outside analysts who must name carriers and hidden compensators without seeing the author's labels.

Table 33. Branch card, IC.

Branch object	Mapping (condensed from the source)
State X*	Longitudinal human + operational state: biological reserve, cognition, trauma history, family/social relations, employment, entrepreneurship, cashflow, digital systems, provenance, institutional access.
Receiver schema	Family, university, employer, bank, customer, clinical, legal and social schemas applied to the same underlying human/operational record.
Local boundary S	Visible behavior, job title, account snapshot, public presentation, single incident or local institutional category.
Consequential boundary G	Whole person-environment-enterprise-provenance system across time.
Displaced state D	Biological wear, financial depletion, unsupported labor, proof burden, trust loss, delayed opportunity, institutional misrecognition.
Candidate carriers C	The human biological/financial carrier and later enterprise/institutional nodes.
IAMF-P capacity / action	Schema repair, provenance architecture, delegation, institutional scaffolding, reciprocal safety, governed stewardship.
Current evidence	The index corpus contains chronology, evidence classes, 15 contradictions, 8-node execution, exact financial records, schema-gap analysis and falsification rules. It is the discovery record, not independent proof of universality.

Table 34. Test register for branch IC. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
IC-T01 State fidelity	Freeze a pre-outcome reconstruction of: Longitudinal human + operational state: biological reserve, cognition, trauma history, family/social relations, employment, entrepreneurship, cashflow, digital systems, provenance, institutional access.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T02 Schema-gap measurement	Formalize this receiver representation: Family, university, employer, bank, customer, clinical, legal and social schemas applied to the same underlying human/operational record.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.

Test	Branch-specific operationalisation	Status and evidence note
IC-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Whole person-environment-enterprise- provenance system across time.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T05 Boundary divergence	Compare S = Visible behavior, job title, account snapshot, public presentation, single incident or local institutional category. against G = Whole person-environment- enterprise-provenance system across time.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Biological wear, financial depletion, unsupported labor, proof burden, trust loss, delayed opportunity, institutional misrecognition.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: The human biological/financial carrier and later enterprise/institutional nodes.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Schema repair, provenance architecture, delegation, institutional scaffolding, reciprocal safety, governed stewardship.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
IC-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
IC-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
IC-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
IC-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**SOURCE DOCUMENTED** Recorded in the author corpus. Discovery provenance, not independent proof.
IC-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B01 · tests B01-T01 to B01-T18

Luxury / physical assets

Current branch classification: STRONG STRUCTURAL SUPPORT; FULL MU+ OPEN

IAMF-P build: Authentication, restoration, provenance, stewardship, distribution and customer-trust capacity.

Editor's reading. Luxury goods make schema gaps unusually visible: authenticity, condition and provenance are exactly the variables a buyer cannot observe. **Status profile:** 0 source documented, 8 phenomenon documented, 5 link partial, 5 kernel test open, 0 not established. The unknown is whether provenance capacity beats simple price discounts. I would fund a matched-listings test of a provenance layer against a discount-only incumbent with the same information.

Table 35. Branch card, B01.

Branch object	Mapping (condensed from the source)
State X*	Lifecycle value, provenance, condition, trust, liquidity, restoration state and transaction history.
Receiver schema	Seller/buyer/brand/provenance schemas describing what counts as authentic, viable, degraded or recoverable value.
Local boundary S	Point-of-sale or owner disposal boundary.
Consequential boundary G	Full asset lifecycle plus buyer, brand, logistics, restoration and provenance system.
Displaced state D	Value leakage, authenticity uncertainty, decay, idle inventory, documentation labor, logistics risk.
Candidate carriers C	Owners, buyers, brands, logistics nodes and future inventory state.
IAMF-P capacity / action	Authentication, restoration, provenance, stewardship, distribution and customer-trust capacity.
Current evidence	Author operating record plus independent circular-economy literature on value-retention processes.

Table 36. Test register for branch B01. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B01-T01 State fidelity	Freeze a pre-outcome reconstruction of: Lifecycle value, provenance, condition, trust, liquidity, restoration state and transaction history.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Author operating record plus independent circular-economy literature on value- retention processes.*
B01-T02 Schema-gap measurement	Formalize this receiver representation: Seller/buyer/brand/provenance schemas describing what counts as authentic, viable, degraded or recoverable value.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Full asset lifecycle plus buyer, brand, logistics, restoration and provenance system.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B01-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T05 Boundary divergence	Compare S = Point-of-sale or owner disposal boundary. against G = Full asset lifecycle plus buyer, brand, logistics, restoration and provenance system.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B01-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Value leakage, authenticity uncertainty, decay, idle inventory, documentation labor, logistics risk.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Owners, buyers, brands, logistics nodes and future inventory state.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B01-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B01-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Authentication, restoration, provenance, stewardship, distribution and customer-trust capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B01-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B01-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B01-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B01-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B01-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B01-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B02 · tests B02-T01 to B02-T18

Banking / finance

Current branch classification: STRONG PROPAGATION SUPPORT; PROSPECTIVE MU+ OPEN

IAMF-P build: Systemwide buffers, settlement/liquidity capacity, risk-sharing, collateral design, targeted macroprudential intervention.

Editor's reading. Finance already models contagion, so the question is not whether burden moves but whether the kernel finds the receiving carrier earlier than network stress tests do. **Status profile:** 0 source documented, 5 phenomenon documented, 8 link partial, 5 kernel test open, 0 not established. Strong incumbents (supervisory stress models) make this the hardest fair test. Fund a retrospective carrier-prediction test on public stress data, sealed before outcomes are revealed.

Table 37. Branch card, B02.

Branch object	Mapping (condensed from the source)
State X*	Capital, liquidity, leverage, maturity, counterparties, collateral, NBFI exposures and market volatility.
Receiver schema	Institution/portfolio risk model versus systemwide financial-network state.
Local boundary S	Individual bank, fund or portfolio risk boundary.
Consequential boundary G	Banks + NBFIs + market-based finance + clients + sovereign/household carriers.
Displaced state D	Liquidity stress, fire-sale pressure, margin calls, risk transfer, refinancing burden.
Candidate carriers C	Counterparties, NBFIs, households, firms, sovereigns and future balance sheets.
IAMF-P capacity / action	Systemwide buffers, settlement/liquidity capacity, risk-sharing, collateral design, targeted macroprudential intervention.
Current evidence	IMF 2026 network simulations and systemwide stress-testing work directly document cross-sector amplification channels.

Table 38. Test register for branch B02. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B02-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B02-T04 Friction vector	Apply the "Friction vector" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.

Test	Branch-specific operationalisation	Status and evidence note
B02-T05 Boundary divergence	Compare S = Individual bank, fund or portfolio risk boundary. against G = Banks + NBFIs + market-based finance + clients + sovereign/household carriers.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *IMF 2026 network simulations and systemwide stress-testing work directly document cross-sector amplification channels.*
B02-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Liquidity stress, fire-sale pressure, margin calls, risk transfer, refinancing burden.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B02-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Counterparties, NBFIs, households, firms, sovereigns and future balance sheets.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B02-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B02-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B02-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Systemwide buffers, settlement/liquidity capacity, risk-sharing, collateral design, targeted macroprudential intervention.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T13 Productive transformation	Apply the "Productive transformation" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T14 Mutual uptick	Apply the "Mutual uptick" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B02-T15 Incumbent information parity	Apply the "Incumbent information parity" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B02-T16 Untouched holdout	Apply the "Untouched holdout" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B02-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B02-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B03 · tests B03-T01 to B03-T18

Macroeconomy

Current branch classification: STRONG BOUNDARY SUPPORT; CAUSAL MU+ OPEN

IAMF-P build: Distribution-aware policy/capacity targeted at identified receiving carriers.

Editor's reading. The macroeconomy is the clearest case of headline KPIs hiding distribution: GDP and aggregate savings are boundary choices. **Status profile:** 0 source documented, 6 phenomenon documented, 6 link partial, 6 kernel test open, 0 not established. The risk is over-reading correlation as displacement. Fund a test using household distributional accounts to see whether burden by group is predicted before it shows up in aggregates.

Table 39. Branch card, B03.

Branch object	Mapping (condensed from the source)
State X*	National accounts, sector balances, household income/consumption/saving, investment, energy, employment and resilience.
Receiver schema	Headline aggregate schema versus distributional household/sector representation.
Local boundary S	GDP, aggregate savings or headline macro KPI.
Consequential boundary G	Household groups, sectors, regions and future productive capacity.
Displaced state D	Concentrated fragility or deprivation hidden by aggregate improvement.
Candidate carriers C	Households, sectors, regions, future public/private capacity.
IAMF-P capacity / action	Distribution-aware policy/capacity targeted at identified receiving carriers.
Current evidence	OECD distributional national-account methodology explicitly exists because macro totals can conceal household-group outcomes.

Table 40. Test register for branch B03. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B03-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *T01 State fidelity Freeze a pre-outcome Current evidence supports this reconstruction of: National structural component in accounts, sector balances, Macroeconomy.*
B03-T02 Schema-gap measurement	Formalize this receiver representation: Headline aggregate schema versus distributional household/sector representation.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *OECD distributional national-account methodology explicitly exists because macro totals can conceal household-group outcomes.*

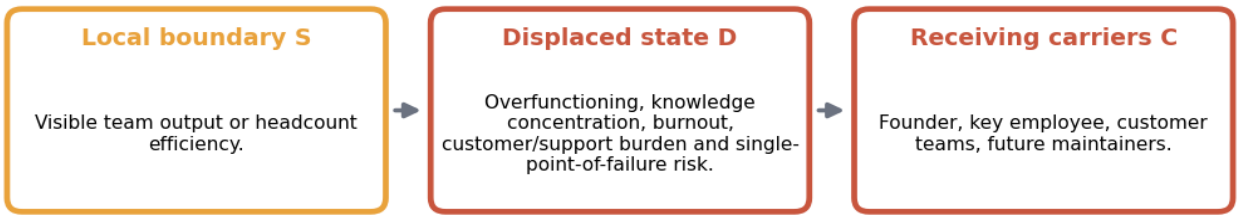
Test	Branch-specific operationalisation	Status and evidence note
B03-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Household groups, sectors, regions and future productive capacity.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B03-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B03-T05 Boundary divergence	Compare S = GDP, aggregate savings or headline macro KPI. against G = Household groups, sectors, regions and future productive capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B03-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B03-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Concentrated fragility or deprivation hidden by aggregate improvement.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B03-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Households, sectors, regions, future public/private capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B03-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B03-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B03-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B03-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Distribution- aware policy/capacity targeted at identified receiving carriers.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B03-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B03-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B03-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B03-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B03-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.

Test	Branch-specific operationalisation	Status and evidence note
B03-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B04 · tests B04-T01 to B04-T18

Organizations / founder systems

Current branch classification: STRONG HIDDEN-COMPENSATION SUPPORT; TRANSFER TEST OPEN



IAMF-P build: Delegation, knowledge diffusion, specialist redundancy, process infrastructure and reciprocal safety.

Editor's reading. Organisations are where hidden compensation is easiest to find and hardest to price: the person who is the missing department. **Status profile:** 0 source documented, 4 phenomenon documented, 9 link partial, 5 kernel test open, 0 not established. Self-report is a trap. Fund a before/after study of a function hand-off in which the compensating person is measured by workload logs, not interviews.

Table 41. Branch card, B04.

Branch object	Mapping (condensed from the source)
State X*	Output, knowledge distribution, roles, complexity, time, staffing, support, redundancy and turnover.
Receiver schema	Formal org chart/title versus actual function graph and knowledge concentration.
Local boundary S	Visible team output or headcount efficiency.
Consequential boundary G	Full support architecture including key-person dependence, customer handoffs and future maintenance.
Displaced state D	Overfunctioning, knowledge concentration, burnout, customer/support burden and single-point-of-failure risk.
Candidate carriers C	Founder, key employee, customer teams, future maintainers.
IAMF-P capacity / action	Delegation, knowledge diffusion, specialist redundancy, process infrastructure and reciprocal safety.
Current evidence	Knowledge-diffusion/task-assignment research reports maintenance- cost and resilience gains when concentrated knowledge is deliberately redistributed.

Table 42. Test register for branch B04. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B04-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B04-T04 Friction vector	Apply the "Friction vector" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T05 Boundary divergence	Apply the "Boundary divergence" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.

Test	Branch-specific operationalisation	Status and evidence note
B04-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Overfunctioning, knowledge concentration, burnout, customer/support burden and single-point-of-failure risk.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Knowledge-diffusion/task- assignment research reports maintenance-cost and resilience gains when concentrated knowledge is deliberately redistributed.*
B04-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Founder, key employee, customer teams, future maintainers.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B04-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B04-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Delegation, knowledge diffusion, specialist redundancy, process infrastructure and reciprocal safety.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B04-T13 Productive transformation	Apply the "Productive transformation" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T14 Mutual uptick	Apply the "Mutual uptick" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B04-T15 Incumbent information parity	Apply the "Incumbent information parity" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B04-T16 Untouched holdout	Apply the "Untouched holdout" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B04-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B04-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B05 · tests B05-T01 to B05-T18

Psychology / social legibility

Current branch classification: MECHANISM SUPPORT; INTERNAL STATE PARTIALLY OBSERVABLE

IAMF-P build: Schema correction, safer feedback, support, resource access, reduced proof burden and longitudinal monitoring.

Editor's reading. Legibility is the schema gap applied to people: how a person is read determines what they can access. **Status profile:** 0 source documented, 4 phenomenon documented, 6 link partial, 8 kernel test open, 0 not established. This branch must guard against inferring intent or character from records. Fund a schema-repair field study measuring friction hours before and after a category is added.

Table 43. Branch card, B05.

Branch object	Mapping (condensed from the source)
State X*	Observed behavior, functional output, biological stress, support, trust, access, longitudinal context and self-report.
Receiver schema	Receiver expectations/diagnostic/social categories versus evidence- grounded longitudinal human state.
Local boundary S	Observed symptom or performance snapshot.
Consequential boundary G	Person + environment + support architecture + biological time course.
Displaced state D	Misrecognition, proof burden, withdrawal of support, compensatory overfunctioning and physiological wear.
Candidate carriers C	Human biological, financial and relational systems.
IAMF-P capacity / action	Schema correction, safer feedback, support, resource access, reduced proof burden and longitudinal monitoring.
Current evidence	Allostatic-load literature strongly supports multi-system physiological wear from life-course stress; the exact Rufino schema-causal pathway still requires prospective independent study.

Table 44. Test register for branch B05. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B05-T01 State fidelity	Freeze a pre-outcome reconstruction of: Observed behavior, functional output, biological stress, support, trust, access, longitudinal context and self-report.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Allostatic-load literature strongly supports multi-system physiological wear from life- course stress; the exact Rufino schema-causal pathway still requires prospective independent study.*
B05-T02 Schema-gap measurement	Formalize this receiver representation: Receiver expectations/diagnostic/social categories versus evidence- grounded longitudinal human state.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.

Test	Branch-specific operationalisation	Status and evidence note
B05-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Person + environment + support architecture + biological time course.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B05-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B05-T05 Boundary divergence	Compare S = Observed symptom or performance snapshot. against G = Person + environment + support architecture + biological time course.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B05-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Misrecognition, proof burden, withdrawal of support, compensatory overfunctioning and physiological wear.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Human biological, financial and relational systems.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B05-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Allostatic-load literature strongly supports multi-system physiological wear from life- course stress; the exact Rufino schema-causal pathway still requires prospective independent study.*
B05-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Schema correction, safer feedback, support, resource access, reduced proof burden and longitudinal monitoring.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B05-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B05-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B05-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B06 · tests B06-T01 to B06-T18

Healthcare delivery

Current branch classification: STRONG CARRIER-INTERVENTION SUPPORT; FULL MUTUAL UPTICK OPEN

IAMF-P build: Caregiver-integrated discharge planning, follow-up, coordination, financing and support.

Editor's reading. Healthcare delivery is the most natural home of displaced burden: discharge, referral and prior-authorisation each move work somewhere else. **Status profile:** 0 source documented, 6 phenomenon documented, 7 link partial, 5 kernel test open, 0 not established. Safety dominates. Fund a prospective service redesign with caregiver hours and readmission as co-primary outcomes.

Table 45. Branch card, B06.

Branch object	Mapping (condensed from the source)
State X*	Disease, discharge readiness, caregiver capacity, follow-up, readmission, cost and functional outcome.
Receiver schema	Facility discharge schema versus patient-caregiver-downstream state.
Local boundary S	Hospital throughput/discharge event.
Consequential boundary G	Patient + caregiver + primary/community care + future readmission system.
Displaced state D	Workload, cost, risk and uncertainty shifted to family or downstream care.
Candidate carriers C	Caregivers, patients, clinicians and future admissions.
IAMF-P capacity / action	Caregiver-integrated discharge planning, follow-up, coordination, financing and support.
Current evidence	Meta-analysis of randomized trials found 25% fewer 90-day readmissions and 24% fewer 180-day readmissions with caregiver- integrated discharge planning.

Table 46. Test register for branch B06. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B06-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B06-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B06-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B06-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Meta-analysis of randomized trials found 25% fewer 90-day readmissions and 24% fewer 180-day readmissions with caregiver-integrated discharge planning.*

Test	Branch-specific operationalisation	Status and evidence note
B06-T05 Boundary divergence	Compare S = Hospital throughput/discharge event. against G = Patient + caregiver + primary/community care + future readmission system.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B06-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B06-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Workload, cost, risk and uncertainty shifted to family or downstream care.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B06-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Caregivers, patients, clinicians and future admissions.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B06-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B06-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B06-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B06-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B07 · tests B07-T01 to B07-T18

Cancer / adaptive treatment

Current branch classification: STRONG COUNTERMOVEMENT ANALOGUE; GENERAL RUFINO VALIDATION OPEN

IAMF-P build: Adaptive/combination therapy targeted to dynamic ecological bottlenecks.

Editor's reading. Adaptive therapy offers an independent literature in which maximum-dose strategies are shown to select resistance; the shape matches the law, the clinical claim is not the book's. **Status profile:** 0 source documented, 7 phenomenon documented, 6 link partial, 5 kernel test open, 0 not established. This is research architecture only. The decisive step would be a regulated trial; the book makes no treatment claim.

Table 47. Branch card, B07.

Branch object	Mapping (condensed from the source)
State X*	Tumor clones, sensitive/resistant populations, microenvironment, toxicity, host reserve and treatment schedule.
Receiver schema	Immediate tumor-size response versus evolving tumor ecology and host state.
Local boundary S	Immediate tumor shrinkage / maximum kill.
Consequential boundary G	Tumor ecology + resistant clones + host reserve over time.
Displaced state D	Selection pressure, resistant-pathway dominance and host toxicity.
Candidate carriers C	Resistant clones/pathways, stroma and host reserve.
IAMF-P capacity / action	Adaptive/combination therapy targeted to dynamic ecological bottlenecks.
Current evidence	Adaptive-therapy literature explicitly treats recurrence/resistance as an evolutionary consequence of maximum-tolerated-dose strategies.

Table 48. Test register for branch B07. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B07-T01 State fidelity	Freeze a pre-outcome reconstruction of: Tumor clones, sensitive/resistant populations, microenvironment, toxicity, host reserve and treatment schedule.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Adaptive- therapy literature explicitly treats recurrence/resistance as an evolutionary consequence of maximum-tolerated-dose strategies.*
B07-T02 Schema-gap measurement	Formalize this receiver representation: Immediate tumor- size response versus evolving tumor ecology and host state.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Tumor ecology + resistant clones + host reserve over time.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B07-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T05 Boundary divergence	Compare S = Immediate tumor shrinkage / maximum kill. against G = Tumor ecology + resistant clones + host reserve over time.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Selection pressure, resistant-pathway dominance and host toxicity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Resistant clones/pathways, stroma and host reserve.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Adaptive/combination therapy targeted to dynamic ecological bottlenecks.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B07-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B07-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B07-T16 Untouched holdout	Apply the "Untouched holdout" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B07-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B07-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B08 · tests B08-T01 to B08-T18

Neuroscience / neurodegeneration

Current branch classification: NETWORK SUPPORT; CARRIER-CONSTRUCTION SUPERIORITY OPEN

IAMF-P build: Intervention/support at identified limiting network carrier with multimodal retest.

Editor's reading. Neurodegeneration frames capacity as compensation: the brain keeps function by recruiting reserve until it cannot. **Status profile:** 0 source documented, 5 phenomenon documented, 7 link partial, 6 kernel test open, 0 not established. Hidden compensation is the right lens but identification is hard. Fund longitudinal imaging work that tracks compensatory recruitment against symptom onset.

Table 49. Branch card, B08.

Branch object	Mapping (condensed from the source)
State X*	Signal, network activity, synapses, myelin, glia, vascular/metabolic reserve and clinical function.
Receiver schema	Local biomarker or region-centric model versus whole-network functional state.
Local boundary S	Single biomarker/region endpoint.
Consequential boundary G	Functional neural network + reserve + longitudinal disease trajectory.
Displaced state D	Persistent network limitation despite local improvement.
Candidate carriers C	Rate-limiting network component or support system.
IAMF-P capacity / action	Intervention/support at identified limiting network carrier with multimodal retest.
Current evidence	Functional-network literature shows disease-specific networks can be measured, predict progression and change with treatment.

Table 50. Test register for branch B08. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B08-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *T01 State fidelity Freeze a pre-outcome Current evidence supports this reconstruction of: Signal, network structural component in activity, synapses, myelin, glia, Neuroscience / neurodegeneration. vascular/metabolic reserve and Functional-network literature clinical function.*
B08-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete. *T02 Schema-gap measurement Formalize this receiver Current literature/corpus makes representation: Local biomarker or the mechanism plausible and region-centric model versus measurable, but the exact frozen- whole-network functional state. kernel T02 isolation is incomplete.*

Test	Branch-specific operationalisation	Status and evidence note
B08-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *T03 Schema-causality intervention Reduce schema mismatch in the Current literature/corpus makes receiver while holding the the mechanism plausible and principal material-resource budget measurable, but the exact frozen- fixed; test whether the kernel T03 isolation is incomplete.*
B08-T04 Friction vector	Apply the "Friction vector" semantics to this branch's native variables, units and feasible actions (see branch card).	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *T04 Friction vector Measure branch-native friction Current evidence supports this created by mismatch/translation, structural component in keeping money, time, energy, Neuroscience / neurodegeneration. biological or trust dimensions Functional-network literature separate.*
B08-T05 Boundary divergence	Compare S = Single biomarker/region endpoint. against G = Functional neural network + reserve + longitudinal disease trajectory.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Functional-network literature shows disease-specific networks can be measured, predict progression and change with treatment.*
B08-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B08-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Persistent network limitation despite local improvement.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Functional-network literature shows disease-specific networks can be measured, predict progression and change with treatment.*
B08-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Rate-limiting network component or support system.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B08-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Intervention/support at identified limiting network carrier with multimodal retest.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T13 Productive transformation	Apply the "Productive transformation" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T14 Mutual uptick	Apply the "Mutual uptick" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B08-T15 Incumbent information parity	Apply the "Incumbent information parity" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B08-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B08-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B08-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B09 · tests B09-T01 to B09-T18

Aging / competing biological constraints

Current branch classification: TRADE-OFF SUPPORT; MUTUAL UPTICK AND CLINICAL VALIDATION OPEN

IAMF-P build: Iterative multi-process intervention with competing-risk and carrier audit.

Editor's reading. Ageing is a many-constraint problem; the kernel's contribution is refusing to optimise one biomarker at the cost of another. **Status profile:** 0 source documented, 5 phenomenon documented, 7 link partial, 6 kernel test open, 0 not established. The weak point is outcomes that take decades. Fund short-horizon proxies with carrier-specific safety limits.

Table 51. Branch card, B09.

Branch object	Mapping (condensed from the source)
State X*	Damage, senescence, genomic integrity, immunity, tissue regeneration, cancer risk and reserve.
Receiver schema	Single-mechanism aging model versus interacting longevity/cancer/tissue-maintenance state.
Local boundary S	One repaired mechanism or biomarker.
Consequential boundary G	Multi-process aging system plus competing risks over time.
Displaced state D	Repair exposes another bottleneck, cancer risk, inflammatory burden or regenerative trade-off.
Candidate carriers C	Next limiting process, tissue or competing risk.
IAMF-P capacity / action	Iterative multi-process intervention with competing-risk and carrier audit.
Current evidence	2025 reviews document deep coupling between aging and cancer and trade-offs between tumor suppression, senescence, regeneration and tissue maintenance.

Table 52. Test register for branch B09. † = status assigned by the default rubric.

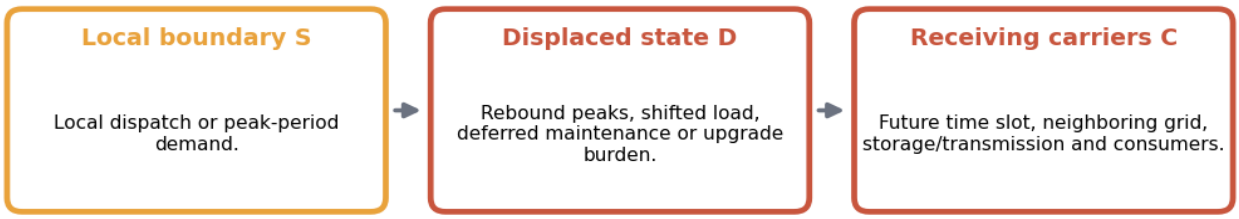
Test	Branch-specific operationalisation	Status and evidence note
B09-T01 State fidelity	Freeze a pre-outcome reconstruction of: Damage, senescence, genomic integrity, immunity, tissue regeneration, cancer risk and reserve.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *2025 reviews document deep coupling between aging and cancer and trade-offs between tumor suppression, senescence, regeneration and tissue maintenance.*
B09-T02 Schema-gap measurement	Formalize this receiver representation: Single-mechanism aging model versus interacting longevity/cancer/tissue- maintenance state.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Multi-process aging system plus competing risks over time.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B09-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.

Test	Branch-specific operationalisation	Status and evidence note
B09-T05 Boundary divergence	Compare S = One repaired mechanism or biomarker. against G = Multi-process aging system plus competing risks over time.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B09-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B09-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Repair exposes another bottleneck, cancer risk, inflammatory burden or regenerative trade-off.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *2025 reviews document deep coupling between aging and cancer and trade-offs between tumor suppression, senescence, regeneration and tissue maintenance.*
B09-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Next limiting process, tissue or competing risk.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B09-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Iterative multi- process intervention with competing-risk and carrier audit.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B09-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B09-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B09-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B09-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B10 · tests B10-T01 to B10-T18

Energy / power grids

Current branch classification: STRONG REBOUND SUPPORT; FULL SYSTEM MU+ OPEN



IAMF-P build: Co-optimized controls, storage, transmission, demand response, envelope efficiency and redundancy.

Editor's reading. Grids make rebound physical and measurable, which is why demand response is the cleanest engineering test of consequential control. **Status profile:** 0 source documented, 9 phenomenon documented, 4 link partial, 5 kernel test open, 0 not established. Fund a demand-response dataset comparison of local dispatch against rebound-aware dispatch with comfort and emissions recorded.

Table 53. Branch card, B10.

Branch object	Mapping (condensed from the source)
State X*	Generation, demand, storage, transmission, price, comfort, emissions and maintenance.
Receiver schema	Local peak/control model versus grid + recovery-period + consumer state.
Local boundary S	Local dispatch or peak-period demand.
Consequential boundary G	Grid + later rebound period + comfort + emissions + reliability.
Displaced state D	Rebound peaks, shifted load, deferred maintenance or upgrade burden.
Candidate carriers C	Future time slot, neighboring grid, storage/transmission and consumers.
IAMF-P capacity / action	Co-optimized controls, storage, transmission, demand response, envelope efficiency and redundancy.
Current evidence	2026 Energy and Buildings study reports 64.16% on-peak cooling reduction and 8.70% rebound-peak reduction without aggregate comfort deterioration in modeled cases.

Table 54. Test register for branch B10. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B10-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B10-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B10-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B10-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. B10-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
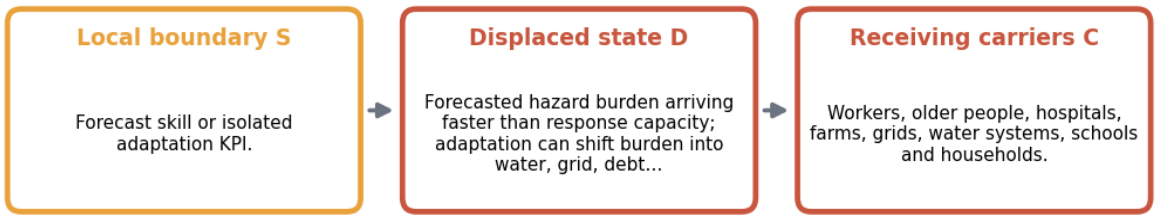
B10-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B10-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B11 · tests B11-T01 to B11-T18

Weather / climate / disaster response

Current branch classification: LIVE PROSPECTIVE ARENA; FULL OUTCOME NOT YET OBSERVED



IAMF-P build: Cooling, water, clinic, food/logistics, energy and finance capacity built before peak burden; post-event whole-system retest.

Editor's reading. Disaster response is where time-shifted burden is vivid: preparedness deferred becomes cost at the peak. **Status profile:** 0 source documented, 8 phenomenon documented, 5 link partial, 5 kernel test open, 0 not established. Fund prospective site matching, then freeze the rules before the event, as the PHOTOSYNTHESIS protocol intends.

Table 55. Branch card, B11.

Branch object	Mapping (condensed from the source)
State X*	Temperature, rainfall, WBGT, water, soil, reservoirs, grid, health, crops, food, income and exposed population.
Receiver schema	Forecast/hazard representation versus locality-specific exposure and response-capacity map.
Local boundary S	Forecast skill or isolated adaptation KPI.
Consequential boundary G	Exposed population + infrastructure + health + food + finance + neighboring systems.
Displaced state D	Forecasted hazard burden arriving faster than response capacity; adaptation can shift burden into water, grid, debt or wages.
Candidate carriers C	Workers, older people, hospitals, farms, grids, water systems, schools and households.
IAMF-P capacity / action	Cooling, water, clinic, food/logistics, energy and finance capacity built before peak burden; post-event whole-system retest.
Current evidence	NOAA/WMO 2026 forecasts create a live prospective window; FAO/WFP are funding anticipatory action before impacts peak; WHO specifies warning, risk-group, health-system, surveillance and learning layers.

Table 56. Test register for branch B11. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B11-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B11-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B11-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B11-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. B11-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*

Test	Branch-specific operationalisation	Status and evidence note
B11-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B11-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B12 · tests B12-T01 to B12-T18

Supply chains / logistics

Current branch classification: STRONG PROPAGATION SUPPORT; MUTUAL-UPTICK VALIDATION OPEN

IAMF-P build: Information sharing, supplier finance, buffers, routing redundancy, SLA redesign and capacity at bottlenecks.

Editor's reading. Supply chains show the bullwhip effect: small local signals amplified through hops, a direct cousin of the multi-hop toy. **Status profile:** 0 source documented, 6 phenomenon documented, 7 link partial, 5 kernel test open, 0 not established. Fund multi-tier event data to test whether the worst-hop and catchment predictions beat standard inventory policies.

Table 57. Branch card, B12.

Branch object	Mapping (condensed from the source)
State X*	Demand, orders, inventory, cash, lead time, supplier reserve, transportation and service level.
Receiver schema	Each tier's local demand/order representation versus end-demand and multi-tier network state.
Local boundary S	Buyer/local working-capital objective.
Consequential boundary G	Multi-tier supply chain over time.
Displaced state D	Variability amplification, supplier fragility, future stockouts, expedite cost and working-capital burden.
Candidate carriers C	Upstream suppliers, transport nodes, finance and future inventory positions.
IAMF-P capacity / action	Information sharing, supplier finance, buffers, routing redundancy, SLA redesign and capacity at bottlenecks.
Current evidence	Classic bullwhip research shows order-information distortion and increasing upstream variability, with mitigation strategies.

Table 58. Test register for branch B12. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B12-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B12-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B12-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B12-T04 Friction vector	Apply the "Friction vector" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.

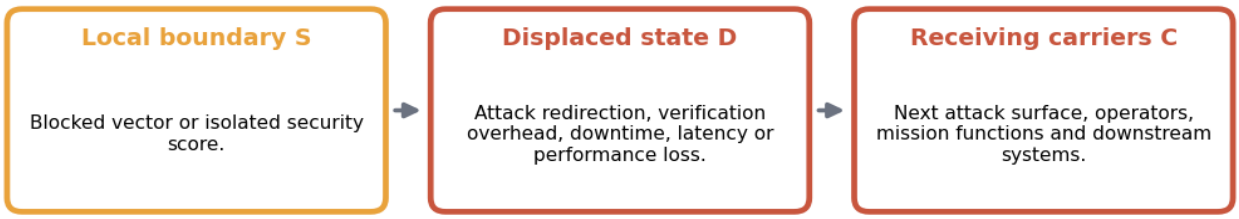
Test	Branch-specific operationalisation	Status and evidence note
B12-T05 Boundary divergence	Compare S = Buyer/local working-capital objective. against G = Multi-tier supply chain over time.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Classic bullwhip research shows order-information distortion and increasing upstream variability, with mitigation strategies.*
B12-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B12-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Variability amplification, supplier fragility, future stockouts, expedite cost and working-capital burden.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B12-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Upstream suppliers, transport nodes, finance and future inventory positions.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B12-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B12-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B12-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B12-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Information sharing, supplier finance, buffers, routing redundancy, SLA redesign and capacity at bottlenecks.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B12-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B12-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B12-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B12-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B12-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.

Test	Branch-specific operationalisation	Status and evidence note
B12-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B13 · tests B13-T01 to B13-T18

Cybersecurity

Current branch classification: RECURRENT ADAPTATION SUPPORT; ADVERSARIAL PREDICTION OPEN



IAMF-P build: Moving-target defense, redundancy, recovery, verification and carrier- specific controls.

Editor's reading. Cybersecurity has real adversaries, and the kernel is explicit that an attacker is an adverse process, not a carrier owed a gain. **Status profile:** 0 source documented, 7 phenomenon documented, 5 link partial, 6 kernel test open, 0 not established. This branch is defensive architecture only. Fund detection and recovery studies on public incident data.

Table 59. Branch card, B13.

Branch object	Mapping (condensed from the source)
State X*	Attack graph, exposure, detection, response, availability, real-time performance and human workload.
Receiver schema	Defender model of attack surface versus evolving attacker-accessible state.
Local boundary S	Blocked vector or isolated security score.
Consequential boundary G	Adaptive attacker-defender-operational system.
Displaced state D	Attack redirection, verification overhead, downtime, latency or performance loss.
Candidate carriers C	Next attack surface, operators, mission functions and downstream systems.
IAMF-P capacity / action	Moving-target defense, redundancy, recovery, verification and carrier- specific controls.
Current evidence	2026 MTD survey explicitly evaluates security gains against real-time performance, deployment feasibility and operational trade-offs.

Table 60. Test register for branch B13. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B13-T01 State fidelity	Freeze a pre-outcome reconstruction of: Attack graph, exposure, detection, response, availability, real-time performance and human workload.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *2026 MTD survey explicitly evaluates security gains against real-time performance, deployment feasibility and operational trade-offs.*
B13-T02 Schema-gap measurement	Formalize this receiver representation: Defender model of attack surface versus evolving attacker-accessible state.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B13-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Adaptive attacker-defender-operational system.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B13-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.

Test	Branch-specific operationalisation	Status and evidence note
B13-T05 Boundary divergence	Compare S = Blocked vector or isolated security score. against G = Adaptive attacker-defender-operational system.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B13-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B13-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Attack redirection, verification overhead, downtime, latency or performance loss.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B13-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Next attack surface, operators, mission functions and downstream systems.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B13-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B13-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.

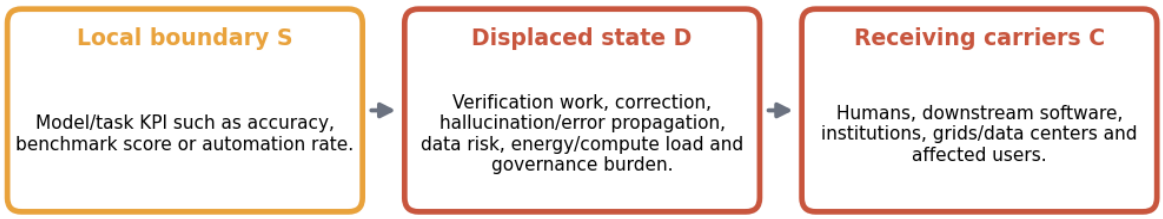
B13-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Moving-target defense, redundancy, recovery, verification and carrier-specific controls.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B13-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B13-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B13-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B13-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B13-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B13-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B14 · tests B14-T01 to B14-T18

AI systems / agents

Current branch classification: STRONG SCHEMA/FRICTION RELEVANCE; FULL LIVE BENCHMARK OPEN



IAMF-P build: Provenance, schema correction, escalation, human review capacity, redundancy, workflow redesign and efficient compute.

Editor's reading. AI agents turn the schema gap into an engineering problem: the world model is never the world. **Status profile:** 0 source documented, 6 phenomenon documented, 7 link partial, 5 kernel test open, 0 not established. Fund matched agent workflows measuring human review minutes and error cost under information parity.

Table 61. Branch card, B14.

Branch object	Mapping (condensed from the source)
State X*	Task accuracy, world/context representation, provenance, compute, energy, human review, latency, downstream errors and organizational effects.
Receiver schema	Model/agent representation and organizational deployment schema versus evidence-grounded task/world state.
Local boundary S	Model/task KPI such as accuracy, benchmark score or automation rate.
Consequential boundary G	User + human reviewers + organization + infrastructure + downstream decision system.
Displaced state D	Verification work, correction, hallucination/error propagation, data risk, energy/compute load and governance burden.
Candidate carriers C	Humans, downstream software, institutions, grids/data centers and affected users.
IAMF-P capacity / action	Provenance, schema correction, escalation, human review capacity, redundancy, workflow redesign and efficient compute.
Current evidence	NIST treats AI risk across individuals, organizations and society and explicitly notes context loss and human-AI interaction; Stanford, IEA and Gartner quantify adoption, incidents, investment and infrastructure scale.

Table 62. Test register for branch B14. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B14-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = User + human reviewers + organization + infrastructure + downstream decision system.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B14-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *NIST treats AI risk across individuals, organizations and society and explicitly notes context loss and human-AI interaction; Stanford, IEA and Gartner quantify adoption, incidents, investment and infrastructure scale.*
B14-T05 Boundary divergence	Compare S = Model/task KPI such as accuracy, benchmark score or automation rate. against G = User + human reviewers + organization + infrastructure + downstream decision system.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B14-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Verification work, correction, hallucination/error propagation, data risk, energy/compute load and governance burden.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B14-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Humans, downstream software, institutions, grids/data centers and affected users.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Candidate build: Provenance, schema correction, escalation, human review capacity, redundancy, workflow redesign and efficient compute.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
B14-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B14-T16 Untouched holdout	Apply the "Untouched holdout" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B14-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B14-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B15 · tests B15-T01 to B15-T18

Public administration

Current branch classification: STRONG USER-SIDE FRICTION SUPPORT; MUTUAL-UPTICK TRIALS OPEN

IAMF-P build: Shared data, simplified interfaces, proactive service, navigation support and error-correction capacity.

Editor's reading. Public administration exports time to citizens, and few countries measure it, which makes the carrier ledger largely blank. **Status profile:** 0 source documented, 7 phenomenon documented, 6 link partial, 5 kernel test open, 0 not established. Fund a user-side transaction-cost measurement across one service before anything is redesigned.

Table 63. Branch card, B15.

Branch object	Mapping (condensed from the source)
State X*	Agency cost, citizen burden, access, delay, documents, handoffs, errors and rights/service outcome.
Receiver schema	Institutional process/eligibility schema versus citizen life situation and actual service need.
Local boundary S	Agency internal efficiency or case-processing cost.
Consequential boundary G	Citizen-state journey across agencies and time.
Displaced state D	Learning, compliance, waiting, repeated documentation, correction effort and psychological cost.
Candidate carriers C	Citizens, firms, case workers and future service demand.
IAMF-P capacity / action	Shared data, simplified interfaces, proactive service, navigation support and error-correction capacity.
Current evidence	OECD 2026 states services can appear efficient internally while imposing significant transaction costs on users; only 10/36 OECD countries report standardized measurement mechanisms/guidance.

Table 64. Test register for branch B15. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B15-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *T01 State fidelity Freeze a pre-outcome Current evidence supports this reconstruction of: Agency cost, structural component in Public citizen burden, access, delay, administration. OECD 2026 states documents, handoffs, errors and services can appear efficient rights/service outcome.*
B15-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *T02 Schema-gap measurement Formalize this receiver Current evidence supports this representation: Institutional structural component in Public process/eligibility schema versus administration. OECD 2026 states citizen life situation and actual services can appear efficient service need.*

Test	Branch-specific operationalisation	Status and evidence note
B15-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *T03 Schema-causality intervention Reduce schema mismatch in the Current literature/corpus makes receiver while holding the the mechanism plausible and principal material-resource budget measurable, but the exact frozen- fixed; test whether the kernel T03 isolation is incomplete.*
B15-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. BRANCH B16 · tests B16-T01 to B16-T18

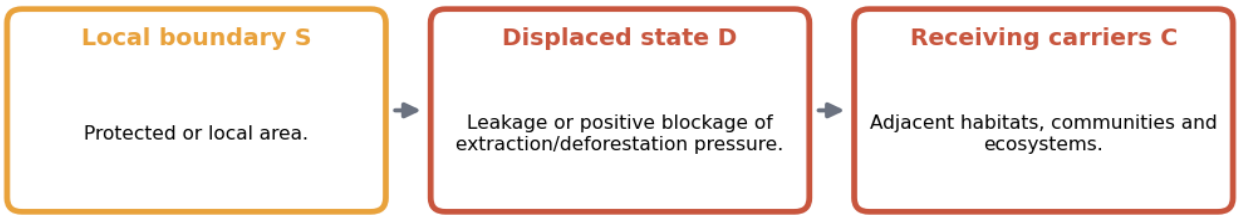
Ecology / commons

Current branch classification: STRONG NULL + LEAKAGE EVIDENCE; MUTUAL-UPTICK SYSTEM TEST OPEN



IAMF-P build: Habitat design, quotas, monitoring, polycentric governance and surrounding-landscape capacity.

Editor's reading. Ecology offers the clearest nulls: protected areas sometimes leak, sometimes block, sometimes do nothing, and the kernel has to report all three. **Status profile:** 0 source documented, 6 phenomenon documented, 7 link partial, 5 kernel test open, 0 not established. Fund a matched protected-area leakage study with explicit null criteria.

Table 65. Branch card, B16.

Branch object	Mapping (condensed from the source)
State X*	Species, habitat, land use, pollutants, harvest, governance and surrounding community/ecosystem state.
Receiver schema	Protected-area/local conservation accounting versus landscape-scale ecological/social system.
Local boundary S	Protected or local area.
Consequential boundary G	Networked ecosystem + adjacent land use + affected communities.
Displaced state D	Leakage or positive blockage of extraction/deforestation pressure.
Candidate carriers C	Adjacent habitats, communities and ecosystems.
IAMF-P capacity / action	Habitat design, quotas, monitoring, polycentric governance and surrounding-landscape capacity.
Current evidence	Systematic review of 3,398 protected-area observations/records in the review corpus; the manuscript separately reports 2,575 effective/analyzable PAs for the 11.8% leakage / 54.8% blockage / 33.4% no-spillover subset found both leakage and positive blockage plus null cases, providing an unusually strong falsifiability/null-control example.

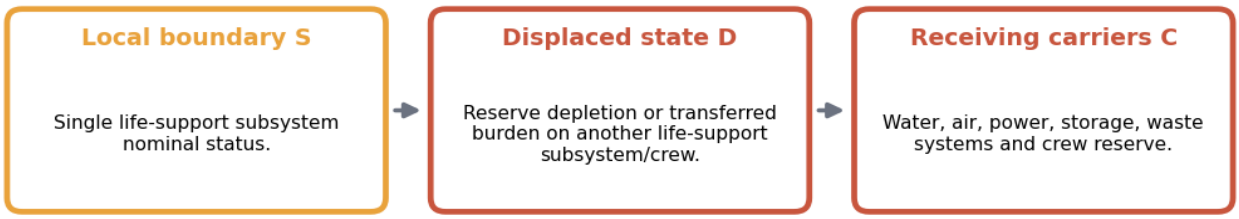
Spacecraft / closed-loop life support

Current branch classification: STRONG CLOSED-LOOP ENGINEERING SUPPORT; CROSS-SYSTEM MU+ OPEN



IAMF-P build: Recovery, storage, routing, redundancy, repair, quality testing and reprocessing.

Editor's reading. Closed-loop life support already practises capture, transform, test and reprocess, so it is the nearest existing engineering analogue of the constructive operator. **Status profile:** 0 source documented, 11 phenomenon documented, 2 link partial, 5 kernel test open, 0 not established. Because structure is already present, the open question is only prospective superiority. Fund a benchmark against current ECLSS performance data.

Table 67. Branch card, B17.

Branch object	Mapping (condensed from the source)
State X*	O2, CO2, H2O, thermal state, waste, power, crew, reserves and subsystem reliability.
Receiver schema	Subsystem nominal-status representation versus mission-wide material/energy/crew loop.
Local boundary S	Single life-support subsystem nominal status.
Consequential boundary G	Mission-wide closed-loop life-support system.
Displaced state D	Reserve depletion or transferred burden on another life-support subsystem/crew.
Candidate carriers C	Water, air, power, storage, waste systems and crew reserve.
IAMF-P capacity / action	Recovery, storage, routing, redundancy, repair, quality testing and reprocessing.
Current evidence	NASA ECLSS directly captures, transforms, tests and reprocesses water/air system outputs; unacceptable water is reprocessed and about 90% of station water is recovered.

Table 68. Test register for branch B17. † = status assigned by the default rubric.

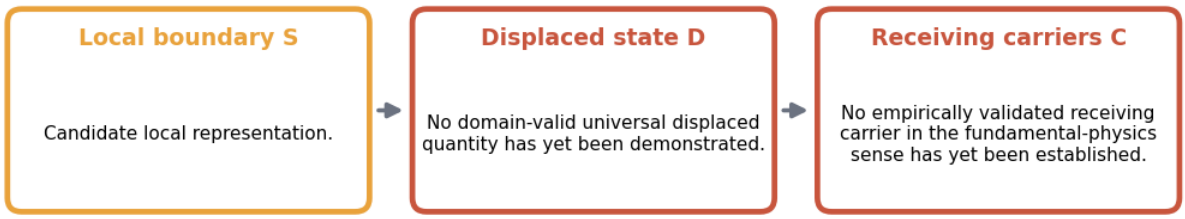
Test	Branch-specific operationalisation	Status and evidence note
B17-T01 State fidelity	Freeze a pre-outcome reconstruction of: O2, CO2, H2O, thermal state, waste, power, crew, reserves and subsystem reliability.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *NASA ECLSS directly captures, transforms, tests and reprocesses water/air system outputs; unacceptable water is reprocessed and about 90% of station water is recovered.*
B17-T02 Schema-gap measurement	Formalize this receiver representation: Subsystem nominal-status representation versus mission-wide material/energy/crew loop.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Mission-wide closed- loop life-support system.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B17-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T05 Boundary divergence	Compare S = Single life-support subsystem nominal status. against G = Mission-wide closed-loop life-support system.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Reserve depletion or transferred burden on another life-support subsystem/crew.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Water, air, power, storage, waste systems and crew reserve.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Recovery, storage, routing, redundancy, repair, quality testing and reprocessing.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
B17-T13 Productive transformation	Apply the "Productive transformation" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B17-T14 Mutual uptick	Apply the "Mutual uptick" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B17-T15 Incumbent information parity	Apply the "Incumbent information parity" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B17-T16 Untouched holdout	Apply the "Untouched holdout" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
B17-T17 Sensitivity and identifiability	Apply the "Sensitivity and identifiability" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
B17-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH B18 · tests B18-T01 to B18-T18

Fundamental physics / pure mathematics

Current branch classification: NOT ESTABLISHED AS FUNDAMENTAL LAW / THEOREM



IAMF-P build: Requires a genuinely new falsifiable physical prediction, invariant, or theorem-level result with independent verification.

Editor's reading. Fundamental physics is retained as a deliberate non-pass: the book does not claim new laws or theorem-level results. **Status profile:** 0 source documented, 1 phenomenon documented, 4 link partial, 5 kernel test open, 8 not established. Its value is as a control: a branch the kernel is expected to decline. Do not fund as a validation target.

Table 69. Branch card, B18.

Branch object	Mapping (condensed from the source)
State X*	Native physical state variables, invariants, dimensional quantities; or formal mathematical objects and proof systems.
Receiver schema	Scientific/model representation versus native physical measurement, or formal statement versus proof semantics.
Local boundary S	Candidate local representation.
Consequential boundary G	Must be defined by native physics/mathematics, not imported metaphorically.
Displaced state D	No domain-valid universal displaced quantity has yet been demonstrated.
Candidate carriers C	No empirically validated receiving carrier in the fundamental-physics sense has yet been established.
IAMF-P capacity / action	Requires a genuinely new falsifiable physical prediction, invariant, or theorem-level result with independent verification.
Current evidence	Current corpus does not establish a new fundamental interaction, conservation law, constant or theorem. This branch is intentionally retained as a hard non-pass rather than forced into universality.

Table 70. Test register for branch B18. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
B18-T01 State fidelity	Freeze a pre-outcome reconstruction of: Native physical state variables, invariants, dimensional quantities; or formal mathematical objects and proof systems.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *Current corpus does not establish a new fundamental interaction, conservation law, constant or theorem. This branch is intentionally retained as a hard non-pass rather than forced into universality.*
B18-T02 Schema-gap measurement	Formalize this receiver representation: Scientific/model representation versus native physical measurement, or formal statement versus proof semantics.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.

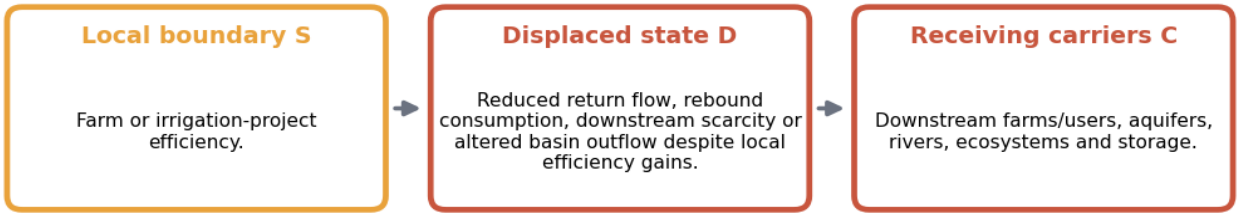
Test	Branch-specific operationalisation	Status and evidence note
B18-T03 Schema-causality intervention	Reduce schema mismatch in the receiver while holding the principal material-resource budget fixed; test whether the downstream decision improves inside G = Must be defined by native physics/mathematics, not imported metaphorically.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *No valid empirical/theorem-level result in the present corpus establishes this test for the claimed fundamental domain. It is retained as a non-pass/open falsification target.*
B18-T04 Friction vector	Measure branch-native friction created by mismatch/translation, keeping money, time, energy, biological or trust dimensions separate.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B18-T05 Boundary divergence	Compare S = Candidate local representation. against G = Must be defined by native physics/mathematics, not imported metaphorically.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B18-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: No domain-valid universal displaced quantity has yet been demonstrated.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: No empirically validated receiving carrier in the fundamental-physics sense has yet been established.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Requires a genuinely new falsifiable physical prediction, invariant, or theorem- level result with independent verification.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**NOT ESTABLISHED** Not established. Retained as a deliberate non-pass.
B18-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B18-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
B18-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

Test	Branch-specific operationalisation	Status and evidence note
B18-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
B18-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

BRANCH H01 · tests H01-T01 to H01-T18

External holdout: water / irrigation

Current branch classification: VERY STRONG BOUNDARY / RETURN-FLOW HOLDOUT; MU+ TRIAL OPEN



IAMF-P build: Basin-aware allocation, return-flow accounting, governance, caps and capacity that preserves downstream value.

Editor's reading. Water is the external holdout: a domain adapter written without tuning against its outcomes. **Status profile:** 0 source documented, 7 phenomenon documented, 6 link partial, 5 kernel test open, 0 not established. Its value is entirely in staying untouched. Fund a basin-scale carrier-prediction test with the kernel frozen first.

Table 71. Branch card, H01.

Branch object	Mapping (condensed from the source)
State X*	Withdrawals, consumptive use, return flows, storage, aquifers, downstream users, crops and basin ecology.
Receiver schema	Farm-efficiency schema versus basin water-accounting state.
Local boundary S	Farm or irrigation-project efficiency.
Consequential boundary G	Basin-scale hydrology + downstream users + ecosystems + storage.
Displaced state D	Reduced return flow, rebound consumption, downstream scarcity or altered basin outflow despite local efficiency gains.
Candidate carriers C	Downstream farms/users, aquifers, rivers, ecosystems and storage.
IAMF-P capacity / action	Basin-aware allocation, return-flow accounting, governance, caps and capacity that preserves downstream value.
Current evidence	2026 syntheses explicitly show farm-level efficiency can fail to create basin-scale savings because return flows are reused and consumption can rebound.

Table 72. Test register for branch H01. † = status assigned by the default rubric.

Test	Branch-specific operationalisation	Status and evidence note
H01-T01 State fidelity	Apply the "State fidelity" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
H01-T02 Schema-gap measurement	Apply the "Schema-gap measurement" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.
H01-T03 Schema-causality intervention	Apply the "Schema-causality intervention" semantics to this branch's native variables, units and feasible actions (see branch card).	**KERNEL TEST OPEN †** Protocol defined. No sealed parity, holdout or replication result yet.
H01-T04 Friction vector	Apply the "Friction vector" semantics to this branch's native variables, units and feasible actions (see branch card).	**LINK PARTIAL †** A constituent link is measurable; end-to-end isolation is incomplete.

Test	Branch-specific operationalisation	Status and evidence note
H01-T05 Boundary divergence	Compare S = Farm or irrigation- project efficiency. against G = Basin-scale hydrology + downstream users + ecosystems + storage.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown. *2026 syntheses explicitly show farm- level efficiency can fail to create basin-scale savings because return flows are reused and consumption can rebound.*
H01-T06 Null-boundary control	Select aligned/null or positive- spillover cases before outcomes are revealed; the law must correctly return no activation when consequential divergence is immaterial.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T07 Directed displacement	Estimate displacement relative to a declared counterfactual. Candidate displaced state: Reduced return flow, rebound consumption, downstream scarcity or altered basin outflow despite local efficiency gains.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T08 Prospective carrier prediction	Predict the receiving carrier before reveal. Candidate carrier space: Downstream farms/users, aquifers, rivers, ecosystems and storage.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T09 Coupling-path identification	Identify the causal handoff/coupling that moves state from the optimized boundary to the receiving carrier; validate with temporal, network, experimental or quasi-experimental evidence where available.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T10 Hidden compensation	Remove, reduce or separately measure the suspected compensator and observe whether visible stability falls; distinguish true system capacity from borrowed capacity.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T11 Reconciliation Velocity Gap	Build a time series of unresolved burden U(t) and carrier reconciliation capacity R_C(t); test whether RVG = dU/dt - dR_C/dt predicts accumulation or failure.	**PHENOMENON DOCUMENTED** Independent literature documents the phenomenon or a link. Frozen-kernel isolation not shown.
H01-T12 Capacity construction	Compare routing/redistribution with actual capacity construction. Candidate build: Basin-aware allocation, return-flow accounting, governance, caps and capacity that preserves downstream value.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
H01-T13 Productive transformation	Where domain-valid, convert recoverable displaced state into a higher-value state and audit all new costs/carriers. If transformation is physically meaningless in the branch, record N/A rather than force it.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
H01-T14 Mutual uptick	Require Mutual Uptick: every material carrier has a positive preregistered consequential value change, with no protected safety dimension deteriorating beyond tolerance and no new hidden loser.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
H01-T15 Incumbent information parity	Run 2x2 information-parity design: same information/incumbent objective; same information/Rufino objective; expanded consequential information/incumbent objective; expanded information/Rufino objective.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.
H01-T16 Untouched holdout	Freeze K_R, branch adapter, endpoints and carrier-prediction rule, then run a second untouched dataset/system with outcomes sealed.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet. *Status remains OPEN.*
H01-T17 Sensitivity and identifiability	Stress units, uncertainty, alternative causal histories, thresholds, missingness and parameter choices; return UNKNOWN when materially different histories are observationally equivalent.	**LINK PARTIAL** A constituent link is measurable; end-to-end isolation is incomplete.
H01-T18 Independent replication	Unaffiliated operators reproduce or falsify this branch test from auditable data, code and the frozen adapter.	**KERNEL TEST OPEN** Protocol defined. No sealed parity, holdout or replication result yet.

PART VII

The Frontier Atlas

One hundred domain adapters in ten families: a construction brief for each, never a validation claim.

FRONTIER ATLAS

How the Atlas Works

The atlas is a hypothesis generator. Its hundred entries exist because the book aims to be complete across categories of reality, but they are **not** counted as a hundred kernel validations. Each adapter must earn its own causal identification, null controls, parity benchmark, prospective holdout and independent replication, and any adapter may legitimately return NO ACTIVATION, UNKNOWN or NO FEASIBLE MU+.

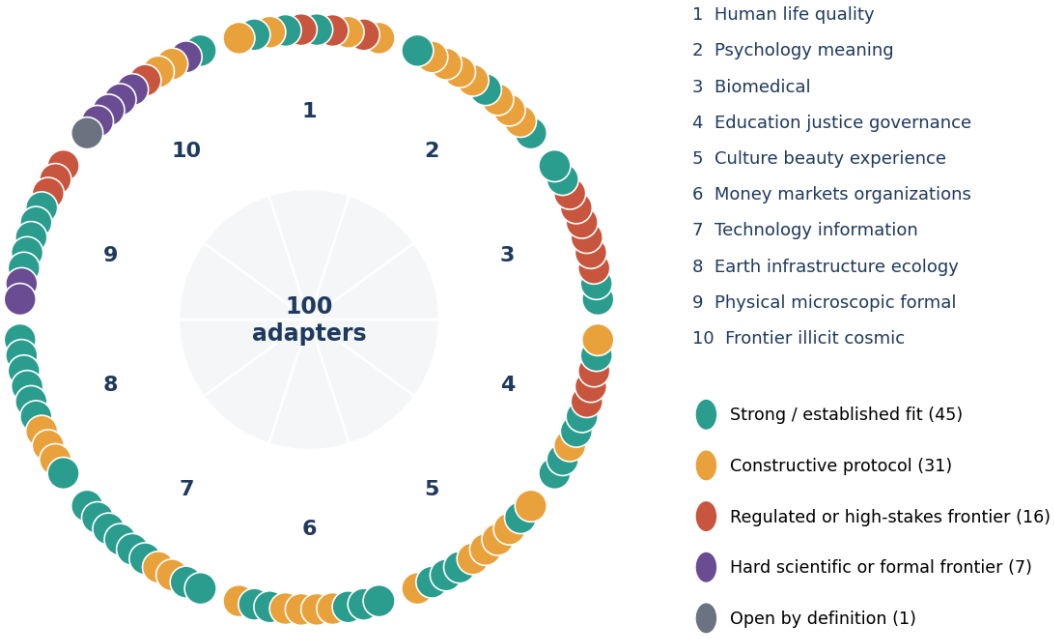


Figure 31. The 100 adapters in ten families, coloured by the current position assigned in the source. Strong or established fit: 45. Constructive protocol: 31. Regulated or high-stakes frontier: 16. Hard scientific or formal frontier: 7. Open by definition: 1.

The fields every entry exposes

Table 73. Required fields of every atlas entry.

Field	Question it answers
X*	What is the evidence-grounded state?
Σ	Through what schema is the state recognised today?
B	What blocker prevents Mutual Uptick?
C	Which carriers receive the displaced burden?
ΔR	What missing structure must be built?
MU+	What counts as every carrier gaining?
Frontier-market class	What kind of venture, if any, the unresolved burden implies
Decisive test	What single design would most sharpen the evidence?

Commercial note on every entry

Persistent unresolved burden can indicate demand, but profitability is never guaranteed. Adoption, regulation, legality, ethics, capital intensity, competition, willingness to pay and execution remain separate gates (Chapter 25). In regulated or safety-critical families the entry is a research architecture, not a treatment, legal decision or deployment authorisation.

Figure 32. Composition of the atlas: the number of adapters in each family by position class. Most entries are strong structural fits or constructive protocols; the hard frontiers sit mainly in the physical and cosmic families.

FAMILY 1 OF 10 · ADAPTERS 001 TO 010

Human life quality

Editor's overview. Closest to the individual: measurement is multidimensional and cost of error is human.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Guardrail

Entries in this family concern health, mind or wellbeing. They are research architectures for measurement and construction, not diagnoses, treatments or recommendations for any individual.

Table 74. Family 1: Human life quality.

No.	Domain	Current position	Frontier-market class
001	**Whole-person quality of life**	Constructive protocol	Life-quality operating systems; preventive orchestration; integrated support infrastructure
002	**Nutrition and metabolism**	Regulated empirical frontier	Adaptive nutrition platforms; metabolic food infrastructure
003	**Sleep and recovery**	Constructive protocol	Recovery systems; circadian workplace infrastructure
004	**Reproductive and sexual health**	Regulated empirical frontier	Reproductive-health orchestration; fertility and sexual-health infrastructure
005	**Disability and accessibility**	Strong constructive fit	Accessibility-by-default products; adaptive interfaces
006	**Mobility and physical function**	Regulated empirical frontier	Rehabilitation platforms; adaptive mobility systems
007	**Family and caregiving**	Strong structural fit	Care coordination; respite infrastructure; family operating systems
008	**Safety and personal security**	Constructive protocol	Personal safety infrastructure; safer-environment design
009	**Housing and domestic environment**	Strong structural fit	Adaptive housing; healthy-building services
010	**Human longevity and life-course planning**	Constructive protocol	Longevity planning; life-course infrastructure

001 Whole-person quality of life

Human life quality | position: **Constructive protocol**

X* state	Health, function, time, autonomy, relationships, safety, income, environment and future capacity
Σ receiver schema	Single score, diagnosis, income bracket or productivity proxy
B blocker to MU+	Improvement in one life dimension paid for by another
C carriers	Person, household, caregivers, future self
ΔR missing structure	Whole-life state model plus coordinated capacity across health, time, income and environment
MU+ acceptance	Health, autonomy, security, time and relational capacity all improve without hidden depletion
Market class	Life-quality operating systems; preventive orchestration; integrated support infrastructure
Decisive test	Longitudinal cohort with preregistered multidimensional outcomes

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

002 Nutrition and metabolism

Human life quality | position: **Regulated empirical frontier**

X* state	Diet, metabolic state, affordability, culture, timing, microbiome and activity
Σ receiver schema	Calories/macros or generic diet categories
B blocker to MU+	Biological benefit shifts cost to adherence, affordability or another metabolic pathway
C carriers	Body, household budget, food system
ΔR missing structure	Adaptive nutrition and access architecture with feedback and affordability constraints
MU+ acceptance	Metabolic markers, adherence, affordability and quality of life improve together
Market class	Adaptive nutrition platforms; metabolic food infrastructure
Decisive test	Randomized adaptive nutrition trial with cost and adherence carriers

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

003 Sleep and recovery

Human life quality | position: **Constructive protocol**

X* state	Sleep architecture, circadian timing, stress, workload, environment and recovery reserve
Σ receiver schema	Hours slept or wearable score
B blocker to MU+	More sleep opportunity can displace work, care or circadian alignment
C carriers	Body, cognition, household schedule
ΔR missing structure	Recovery controller integrating timing, environment, workload and physiology
MU+ acceptance	Recovery, cognition, safety and schedule burden improve together
Market class	Recovery systems; circadian workplace infrastructure
Decisive test	Longitudinal crossover study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

004 Reproductive and sexual health

Human life quality | position: **Regulated empirical frontier**

X* state	Endocrine, reproductive, sexual, relational, consent, fertility and safety state
Σ receiver schema	Single fertility, disease or risk label
B blocker to MU+	Local treatment shifts hormonal, relational, financial or future burden
C carriers	Individual, partner, future child, household
ΔR missing structure	Longitudinal reproductive-state architecture plus consent/safety controls
MU+ acceptance	Health, autonomy, safety and desired reproductive outcomes improve
Market class	Reproductive-health orchestration; fertility and sexual-health infrastructure
Decisive test	Clinical trials + patient-reported and partner- impact carriers

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

005 Disability and accessibility

Human life quality | position: **Strong constructive fit**

X* state	Capabilities plus environmental demands, interfaces and support
Σ receiver schema	Deficit-only person label
B blocker to MU+	Person compensates for inaccessible environment
C carriers	Person, caregiver, workplace, public space
ΔR missing structure	Environment-first accessibility architecture plus assistive capacity
MU+ acceptance	Capability, independence and participation rise while compensatory load falls
Market class	Accessibility-by-default products; adaptive interfaces
Decisive test	Before/after environment redesign with workload measures

Reading. A construction is both specifiable and testable now, often with existing digital telemetry.

006 Mobility and physical function

Human life quality | position: **Regulated empirical frontier**

X* state	Strength, pain, balance, endurance, environment, assistive devices
Σ receiver schema	Single functional score
B blocker to MU+	Function gains can increase pain, fatigue or caregiver burden
C carriers	Body, caregiver, environment
ΔR missing structure	Adaptive rehabilitation plus environment and device redesign
MU+ acceptance	Function, comfort, autonomy and caregiver load improve
Market class	Rehabilitation platforms; adaptive mobility systems
Decisive test	Controlled rehabilitation study

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

007 Family and caregiving

Human life quality | position: **Strong structural fit**

X* state	Needs, capacities, schedules, money, emotional load, dependency and support network
Σ receiver schema	Household role labels
B blocker to MU+	One caregiver silently absorbs system failure
C carriers	Primary caregiver, dependents, siblings, employer
ΔR missing structure	Care-load ledger, shared coordination and external capacity
MU+ acceptance	Dependent wellbeing and caregiver wellbeing both improve
Market class	Care coordination; respite infrastructure; family operating systems
Decisive test	Prospective household burden study

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

008 Safety and personal security

Human life quality | position: **Constructive protocol**

X* state	Threat exposure, environment, support, mobility and response capacity
Σ receiver schema	Incident count or generic risk class
B blocker to MU+	Protection shifts restriction or surveillance burden onto protected person
C carriers	Person, community, responder
ΔR missing structure	Safety architecture that increases protection without reducing autonomy
MU+ acceptance	Threat falls while freedom, privacy and response burden improve
Market class	Personal safety infrastructure; safer-environment design
Decisive test	Prospective safety intervention

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

009 Housing and domestic environment

Human life quality | position: **Strong structural fit**

X* state	Shelter, cost, commute, safety, air, heat, crowding and social context
Σ receiver schema	Property price or occupancy status
B blocker to MU+	Affordability, commute, health and neighborhood burdens trade places
C carriers	Resident, landlord, neighborhood, city
ΔR missing structure	Whole-cost housing and location architecture
MU+ acceptance	Housing quality, affordability, access and neighborhood outcomes improve
Market class	Adaptive housing; healthy-building services
Decisive test	Matched housing intervention

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

010 Human longevity and life-course planning

Human life quality | position: **Constructive protocol**

X* state	Healthspan, lifespan, finances, relationships, purpose and care capacity
Σ receiver schema	Chronological age or retirement age
B blocker to MU+	Longer life shifts burden to morbidity, savings or care system
C carriers	Person, family, institutions, future self
ΔR missing structure	Life-course capital and care architecture
MU+ acceptance	Added years are healthy, funded, connected and autonomous
Market class	Longevity planning; life-course infrastructure
Decisive test	Longitudinal life-course cohort

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

FAMILY 2 OF 10 · ADAPTERS 011 TO 020

Psychology meaning

Editor's overview. Mostly constructive protocols; the ethical care required is highest here.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Guardrail

Entries in this family concern health, mind or wellbeing. They are research architectures for measurement and construction, not diagnoses, treatments or recommendations for any individual.

Table 75. Family 2: Psychology meaning.

No.	Domain	Current position	Frontier-market class
011	**Psychology and social legibility**	Origin-linked structural fit	Precision psychosocial systems
012	**Identity and self-model**	Constructive protocol	Identity infrastructure; privacy-preserving credentials
013	**Relationships and intimacy**	Constructive protocol	Relationship-support systems
014	**Parenting and child development**	Constructive protocol	Developmental support platforms
015	**Purpose and self-actualization**	Origin-linked constructive fit	Human-development and life-design systems
016	**Existential wellbeing**	Constructive protocol	Existential wellbeing services
017	**Spiritual life**	Constructive protocol	Community wellbeing and safeguarding infrastructure
018	**Religion and community institutions**	Constructive protocol	Accountability and safeguarding systems
019	**Emotion and affect regulation**	Constructive protocol	Affect-regulation tools and care systems
020	**Trust and fidelity between people**	Strong structural fit	Relational trust infrastructure

011 Psychology and social legibility

Psychology meaning | position: **Origin-linked structural fit**

X* state	Longitudinal capability, burden, trauma, environment, relationships and compensation
Σ receiver schema	Snapshot diagnosis or social category
B blocker to MU+	High function hides biological and relational cost
C carriers	Person, family, employer, clinician
ΔR missing structure	Multidimensional schema plus support matched to hidden burden
MU+ acceptance	Function, health, autonomy and relationship quality rise while compensation falls
Market class	Precision psychosocial systems
Decisive test	Longitudinal external cohort

Reading. Structurally close to the origin record; needs independent replication.

012 Identity and self-model

Psychology meaning | position: **Constructive protocol**

X* state	Attributes, history, roles, values, capabilities and contexts
Σ receiver schema	Single identity label or credential
B blocker to MU+	Recognition in one schema suppresses other valid dimensions
C carriers	Person and receiving institutions
ΔR missing structure	Selective multi-context identity graph with provenance
MU+ acceptance	Legibility and autonomy improve without forced overexposure
Market class	Identity infrastructure; privacy-preserving credentials
Decisive test	Cross-context identity study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

013 Relationships and intimacy

Psychology meaning | position: **Constructive protocol**

X* state	Needs, boundaries, consent, trust, history, resources and reciprocity
Σ receiver schema	Relationship status or personality label
B blocker to MU+	One partner compensates for unspoken constraints
C carriers	Partners and wider support network
ΔR missing structure	Reciprocal state and burden ledger plus consent architecture
MU+ acceptance	Safety, intimacy, autonomy and fairness improve together
Market class	Relationship-support systems
Decisive test	Dyadic longitudinal study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

014 Parenting and child development

Psychology meaning | position: **Constructive protocol**

X* state	Biology, attachment, education, safety, resources, environment and agency
Σ receiver schema	Age norm, grade or behavior label
B blocker to MU+	Child or parent compensates for missing support
C carriers	Child, parent, school, community
ΔR missing structure	Developmental state map plus distributed support capacity
MU+ acceptance	Child capability and wellbeing rise while caregiver burden falls
Market class	Developmental support platforms
Decisive test	Longitudinal family-school cohort

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

015 Purpose and self-actualization

Psychology meaning | position: **Origin-linked constructive fit**

X* state	Capabilities, values, opportunity, health, autonomy and social contribution
Σ receiver schema	Career status, wealth or productivity proxy
B blocker to MU+	Achievement can be purchased with health or belonging
C carriers	Person, relationships, community
ΔR missing structure	Whole-person capability architecture and burden guardrails
MU+ acceptance	Achievement, health, autonomy and contribution improve together
Market class	Human-development and life-design systems
Decisive test	Longitudinal multidimensional evaluation

Reading. Constructive path is close to the origin record; needs independent replication.

016 Existential wellbeing

Psychology meaning | position: **Constructive protocol**

X* state	Meaning, mortality awareness, belonging, agency and life coherence
Σ receiver schema	Symptom or productivity proxy
B blocker to MU+	Meaning needs displaced into consumption, work or crisis care
C carriers	Person, community
ΔR missing structure	Voluntary meaning-reflection and support architecture
MU+ acceptance	Distress falls while agency, belonging and functioning improve
Market class	Existential wellbeing services
Decisive test	Patient/user-reported longitudinal study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

017 Spiritual life

Psychology meaning | position: **Constructive protocol**

X* state	Belief, practice, meaning, community, conscience and autonomy
Σ receiver schema	Institutional affiliation alone
B blocker to MU+	Community benefit can shift burden to autonomy or dissent
C carriers	Individual, family, community
ΔR missing structure	Voluntary, transparent, safeguarding-centered spiritual/community architecture
MU+ acceptance	Meaning and belonging improve without coercion or exclusion
Market class	Community wellbeing and safeguarding infrastructure
Decisive test	Ethical observational study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

018 Religion and community institutions

Psychology meaning | position: **Constructive protocol**

X* state	Doctrine, governance, resources, safeguarding and member experience
Σ receiver schema	Membership or doctrinal category
B blocker to MU+	Institutional continuity can externalize harm or dissent costs
C carriers	Members, families, leaders, wider community
ΔR missing structure	Transparent governance, reporting, safeguarding and exit rights
MU+ acceptance	Community value rises while coercion and hidden harm fall
Market class	Accountability and safeguarding systems
Decisive test	Institutional longitudinal audit

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

019 Emotion and affect regulation

Psychology meaning | position: **Constructive protocol**

X* state	Internal state, context, physiology, cognition and social feedback
Σ receiver schema	Valence score or symptom label
B blocker to MU+	Suppression improves appearance while physiological load rises
C carriers	Person and relationships
ΔR missing structure	State-aware regulation architecture with physiological feedback
MU+ acceptance	Emotional flexibility and physiological stability improve
Market class	Affect-regulation tools and care systems
Decisive test	Crossover intervention study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

020 Trust and fidelity between people

Psychology meaning | position: **Strong structural fit**

X* state	History, promises, evidence, uncertainty and reciprocity
Σ receiver schema	Trusted/untrusted binary
B blocker to MU+	Trust is maintained by one side absorbing ambiguity or proof burden
C carriers	People and institutions
ΔR missing structure	Dynamic provenance and expectation architecture
MU+ acceptance	Trust, autonomy and verification cost improve together
Market class	Relational trust infrastructure
Decisive test	Prospective trust-repair study

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

FAMILY 3 OF 10 · ADAPTERS 021 TO 030

Biomedical

Editor's overview. Regulated empirical frontier; evidence must come from regulated studies.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Guardrail

Entries in this family concern health, mind or wellbeing. They are research architectures for measurement and construction, not diagnoses, treatments or recommendations for any individual.

Table 76. Family 3: Biomedical.

No.	Domain	Current position	Frontier-market class
021	**Healthcare delivery**	Established adjacent evidence	Whole-system care orchestration
022	**Diagnostics**	Strong structural fit	Diagnostic orchestration and evidence fusion
023	**Cancer ecology**	Regulated empirical frontier	Adaptive oncology control infrastructure
024	**Neuroscience and neurodegeneration**	Regulated empirical frontier	Neuro-reserve diagnostics and restorative platforms
025	**Aging biology**	Regulated empirical frontier	Dynamic longevity orchestration
026	**Immunology**	Regulated empirical frontier	Adaptive immunology platforms
027	**Infectious disease**	Regulated/public-health frontier	Integrated outbreak infrastructure
028	**Microbiome**	Regulated empirical frontier	Microbiome diagnostics/intervention platforms
029	**Genomics and proteomics**	Strong structural fit	Integrated multi-omic platforms
030	**Surgery and rehabilitation**	Strong structural fit	Perioperative operating systems

021 Healthcare delivery

Biomedical | position: **Established adjacent evidence**

X* state	Clinical state, logistics, caregiver capacity, finance and post-discharge environment
Σ receiver schema	Episode-of-care schema
B blocker to MU+	Hospital optimization shifts work to home/caregiver
C carriers	Patient, caregiver, outpatient system
ΔR missing structure	Consequential discharge/care orchestration
MU+ acceptance	Health, readmission risk, caregiver load and cost improve
Market class	Whole-system care orchestration
Decisive test	Pragmatic trial

Reading. Adjacent literature already documents the central mechanism.

022 Diagnostics

Biomedical | position: **Strong structural fit**

X* state	Underlying disease state, uncertainty, test characteristics and downstream actions
Σ receiver schema	Single test result
B blocker to MU+	False certainty moves burden to overtreatment or missed disease Jefferson Rafael Rufino | 180
C carriers	Patient, clinician, payer
ΔR missing structure	Bayesian multi-source diagnostic schema + uncertainty communication
MU+ acceptance	Accuracy, timeliness, burden and downstream safety improve
Market class	Diagnostic orchestration and evidence fusion
Decisive test	Prospective blinded diagnostic study

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

023 Cancer ecology

Biomedical | position: **Regulated empirical frontier**

X* state	Clone mix, immune state, microenvironment, host reserve and therapy exposure
Σ receiver schema	Stage/tumor-size snapshot
B blocker to MU+	Local kill selects resistant carriers or harms host
C carriers	Resistant clones, healthy tissue, immune system
ΔR missing structure	Adaptive ecological state estimator + resistance/host capacity
MU+ acceptance	Tumor, resistance, toxicity and host reserve improve together
Market class	Adaptive oncology control infrastructure
Decisive test	Preclinical then clinical adaptive trial

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

024 Neuroscience and neurodegeneration

Biomedical | position: **Regulated empirical frontier**

X* state	Neural, glial, vascular, metabolic, network and functional state
Σ receiver schema	Single biomarker or visible function
B blocker to MU+	Compensatory recruitment hides reserve depletion Jefferson Rafael Rufino | 181
C carriers	Neural networks, metabolism, caregiver
ΔR missing structure	Multimodal state estimator + restorative capacity controller
MU+ acceptance	Function and reserve rise while damage and compensation fall
Market class	Neuro-reserve diagnostics and restorative platforms
Decisive test	Multimodal longitudinal intervention

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

025 Aging biology

Biomedical | position: **Regulated empirical frontier**

X* state	Coupled damage, repair, senescence, immunity, metabolism and regeneration
Σ receiver schema	Age scalar or isolated hallmark
B blocker to MU+	Repairing one hallmark moves bottleneck elsewhere
C carriers	Cells, tissues, immune system, metabolism
ΔR missing structure	Moving-bottleneck RVG controller across damage/repair channels
MU+ acceptance	Healthspan metrics rise without new dominant damage carrier
Market class	Dynamic longevity orchestration
Decisive test	Preclinical multi-pathway study

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

026 Immunology

Biomedical | position: **Regulated empirical frontier**

X* state	Immune activation, tolerance, pathogen/tumor signals and tissue damage
Σ receiver schema	Single cytokine or cell-count schema Jefferson Rafael Rufino | 182
B blocker to MU+	Stronger response can create autoimmunity/tissue injury
C carriers	Pathogen, immune cells, host tissue
ΔR missing structure	State-dependent immune control balancing clearance and collateral damage
MU+ acceptance	Clearance, tolerance and tissue integrity improve
Market class	Adaptive immunology platforms
Decisive test	Controlled biological study

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

027 Infectious disease

Biomedical | position: **Regulated/public-health frontier**

X* state	Pathogen dynamics, host immunity, behavior, network spread and treatment
Σ receiver schema	Case count or pathogen-only model
B blocker to MU+	Control shifts burden across people, resistance or livelihoods
C carriers	Patients, contacts, health system, economy
ΔR missing structure	Multi-carrier containment + treatment + livelihood capacity
MU+ acceptance	Disease burden falls without disproportionate social/economic harm
Market class	Integrated outbreak infrastructure
Decisive test	Prospective outbreak protocol

Reading. Public-health regulation and ethics govern any test; research architecture only.

028 Microbiome

Biomedical | position: **Regulated empirical frontier**

X* state	Host physiology plus microbial ecology and diet/environment Jefferson Rafael Rufino | 183
Σ receiver schema	Species abundance snapshot
B blocker to MU+	Changing one taxon shifts ecosystem function elsewhere
C carriers	Host and microbial community
ΔR missing structure	Functional ecosystem state model and adaptive intervention
MU+ acceptance	Host outcomes and ecosystem stability improve
Market class	Microbiome diagnostics/intervention platforms
Decisive test	Controlled longitudinal study

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

029 Genomics and proteomics

Biomedical | position: **Strong structural fit**

X* state	Variants, expression, proteins, pathways, context and phenotype
Σ receiver schema	Single marker/pathogenicity label
B blocker to MU+	Marker-driven intervention misses network/context effects
C carriers	Cells, tissues, patient
ΔR missing structure	Multi-omic causal state architecture
MU+ acceptance	Target outcome improves without network collateral burden
Market class	Integrated multi-omic platforms
Decisive test	Prospective multi-omic validation

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

030 Surgery and rehabilitation

Biomedical | position: **Strong structural fit**

X* state	Anatomy, function, pain, recovery capacity, home support and risk Jefferson Rafael Rufino | 184
Σ receiver schema	Procedure success or anatomical correction
B blocker to MU+	Technical success shifts burden to recovery/function
C carriers	Patient, caregiver, rehab system
ΔR missing structure	Prehabilitation + procedure + recovery orchestration
MU+ acceptance	Anatomy, function, pain and recovery burden improve
Market class	Perioperative operating systems
Decisive test	Pragmatic trial

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

FAMILY 4 OF 10 · ADAPTERS 031 TO 040

Education justice governance

Editor's overview. Institutions with documented translation friction; many strong structural fits.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 77. Family 4: Education justice governance.

No.	Domain	Current position	Frontier-market class
031	**Early-childhood development and education**	Strong structural fit	Early-childhood support infrastructure
032	**K-12 education**	Strong structural fit	Adaptive education systems
033	**Higher education**	Constructive protocol	Capability-based higher education
034	**Vocational and workforce learning**	Strong structural fit	Skills marketplaces and apprenticeship systems
035	**Scientific research**	Strong structural fit	Reproducibility infrastructure
036	**Justice and courts**	High-stakes protocol	Justice technology and restitution infrastructure
037	**Policing and public safety systems**	High-stakes protocol	Public-safety coordination and prevention systems
038	**Corrections, rehabilitation and reintegration**	High-stakes protocol	Reentry and rehabilitation infrastructure
039	**Public administration**	Strong structural fit	Government service interoperability
040	**Governance and institutional design**	Constructive protocol	Governance infrastructure and outcome systems

031 Early-childhood development and education

Education justice governance | position: **Strong structural fit**

X* state	Development, safety, language, nutrition, play, attachment and resources
Σ receiver schema	Age milestone or readiness score
B blocker to MU+	Academic gains can shift stress to child/family Jefferson Rafael Rufino | 185
C carriers	Child, caregiver, educator
ΔR missing structure	Integrated developmental support architecture
MU+ acceptance	Learning, wellbeing and caregiver capacity improve
Market class	Early-childhood support infrastructure
Decisive test	Longitudinal program evaluation

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

032 K-12 education

Education justice governance | position: **Strong structural fit**

X* state	Knowledge, skills, wellbeing, context, resources and learning trajectory
Σ receiver schema	Grade/test score
B blocker to MU+	Score gains shift burden to stress, teaching-to-test or exclusion
C carriers	Student, teacher, family
ΔR missing structure	Capability graph + adaptive learning + wellbeing constraints
MU+ acceptance	Learning, wellbeing, teacher load and equity improve
Market class	Adaptive education systems
Decisive test	Cluster randomized trial

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

033 Higher education

Education justice governance | position: **Constructive protocol**

X* state	Capability, knowledge, network, finances and career pathways
Σ receiver schema	Degree/GPA credential
B blocker to MU+	Credential value shifts debt or mismatch to student/employer Jefferson Rafael Rufino | 186
C carriers	Student, family, employer
ΔR missing structure	Capability/provenance portfolio + adaptive pathways
MU+ acceptance	Learning, employability, affordability and wellbeing improve
Market class	Capability-based higher education
Decisive test	Longitudinal graduate outcomes

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

034 Vocational and workforce learning

Education justice governance | position: **Strong structural fit**

X* state	Skills, task demand, wages, mobility and employer needs
Σ receiver schema	Course completion certificate
B blocker to MU+	Training success without placement or wage gain
C carriers	Worker, employer, training provider
ΔR missing structure	Skill-to-task provenance and placement architecture
MU+ acceptance	Skill, earnings, job quality and employer performance improve
Market class	Skills marketplaces and apprenticeship systems
Decisive test	Matched labor-market evaluation

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

035 Scientific research

Education justice governance | position: **Strong structural fit**

X* state	Hypotheses, methods, data, negative results, replication and incentives
Σ receiver schema	Publication/citation unit
B blocker to MU+	Publication success shifts reproducibility burden downstream Jefferson Rafael Rufino | 187
C carriers	Researchers, institutions, public
ΔR missing structure	Experiment provenance + negative-result + replication architecture
MU+ acceptance	Discovery, reproducibility, speed and researcher burden improve
Market class	Reproducibility infrastructure
Decisive test	Cross-lab replication program

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

036 Justice and courts

Education justice governance | position: **High-stakes protocol**

X* state	Facts, evidence, harm, intent, procedure, history and remedies
Σ receiver schema	Case category or docket state
B blocker to MU+	Procedural resolution leaves harm, delay or recurrence elsewhere
C carriers	Victims, accused, families, courts, community
ΔR missing structure	Causal provenance + harm/restitution + recurrence architecture
MU+ acceptance	Accuracy, due process, restoration, safety and timeliness improve
Market class	Justice technology and restitution infrastructure
Decisive test	Prospective process evaluation

Reading. Failure is costly to people; safety constraints dominate and testing must be staged.

037 Policing and public safety systems

Education justice governance | position: **High-stakes protocol**

X* state	Threat, context, evidence, community trust, capacity and alternatives
Σ receiver schema	Incident/offense label
B blocker to MU+	Local enforcement shifts fear, distrust, displacement or recurrence Jefferson Rafael Rufino | 188
C carriers	Residents, officers, victims, institutions
ΔR missing structure	Evidence-first response selection + prevention/support capacity
MU+ acceptance	Safety and trust improve while unnecessary coercive burden falls
Market class	Public-safety coordination and prevention systems
Decisive test	Independent public evaluation

Reading. Failure is costly to people; safety constraints dominate and testing must be staged.

038 Corrections, rehabilitation and reintegration

Education justice governance | position: **High-stakes protocol**

X* state	Risk, harm, needs, skills, housing, work and social support
Σ receiver schema	Sentence/recidivism risk label
B blocker to MU+	Custody may defer burden to reentry, family or community
C carriers	Person, family, community, justice system
ΔR missing structure	Rehabilitation + restitution + housing/work capacity
MU+ acceptance	Safety and reintegration improve while recurrence falls
Market class	Reentry and rehabilitation infrastructure
Decisive test	Longitudinal controlled program

Reading. Failure is costly to people; safety constraints dominate and testing must be staged.

039 Public administration

Education justice governance | position: **Strong structural fit**

X* state	Citizen state, eligibility, documents, services and agency capacity
Σ receiver schema	Program-specific record
B blocker to MU+	Citizen repeatedly translates same reality across agencies Jefferson Rafael Rufino | 189
C carriers	Citizen, frontline staff, budget
ΔR missing structure	Interoperable verified state + once-only data + case orchestration
MU+ acceptance	Access, accuracy, staff workload and cost improve
Market class	Government service interoperability
Decisive test	Agency pilot with citizen/staff metrics

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

040 Governance and institutional design

Education justice governance | position: **Constructive protocol**

X* state	Authority, incentives, information, accountability, resources and affected populations
Σ receiver schema	Organizational chart or legal mandate
B blocker to MU+	Local agency success exports burden to another agency/population
C carriers	Citizens, agencies, future administrations
ΔR missing structure	Cross-boundary outcome ledger + accountability and capacity design
MU+ acceptance	Service quality, legitimacy, cost and resilience improve
Market class	Governance infrastructure and outcome systems
Decisive test	Prospective institutional pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

FAMILY 5 OF 10 · ADAPTERS 041 TO 050

Culture beauty experience

Editor's overview. Value is hard to measure but schema gaps are visible in access and recognition.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 78. Family 5: Culture beauty experience.

No.	Domain	Current position	Frontier-market class
041	**Beauty and aesthetics**	Constructive protocol	Precision aesthetics and beauty systems
042	**Fashion and apparel**	Strong structural fit	Adaptive apparel and circular fashion
043	**Luxury goods**	Origin-business fit	Governed luxury access and authenticated circular luxury
044	**Hospitality**	Strong structural fit	Hospitality operating systems
045	**Travel and tourism**	Constructive protocol	Destination orchestration
046	**Art and cultural markets**	Constructive protocol	Creator-rights and provenance markets
047	**Music and entertainment**	Constructive protocol	Creator economy infrastructure
048	**Gaming and virtual worlds**	Constructive protocol	Virtual-world governance and healthy-economy systems
049	**Sports and performance**	Strong structural fit	Athlete operating systems
050	**Experience design and events**	Constructive protocol	Experience operating systems

041 Beauty and aesthetics

Culture beauty experience | position: **Constructive protocol**

X* state	Biology, preference, culture, identity, safety, cost and perception
Σ receiver schema	Universal beauty standard or product category
B blocker to MU+	Aesthetic gain shifts health, money or self-perception burden
C carriers	Person, body, household
ΔR missing structure	Personalized aesthetic/safety state architecture
MU+ acceptance	Desired aesthetics, health, autonomy and affordability improve
Market class	Precision aesthetics and beauty systems
Decisive test	Consumer/clinical outcome study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

042 Fashion and apparel

Culture beauty experience | position: **Strong structural fit**

X* state	Identity, fit, comfort, durability, labor, inventory and lifecycle
Σ receiver schema	Size/SKU/category schema
B blocker to MU+	Style success shifts fit, waste or labor burden
C carriers	Wearer, worker, retailer, environment
ΔR missing structure	Adaptive sizing + provenance + circularity architecture Jefferson Rafael Rufino | 191
MU+ acceptance	Fit, identity, durability, labor and waste metrics improve
Market class	Adaptive apparel and circular fashion
Decisive test	Retail field experiment

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

043 Luxury goods

Culture beauty experience | position: **Origin-business fit**

X* state	Provenance, scarcity, condition, access, identity, inventory and lifecycle value
Σ receiver schema	Price/status/authenticity binary
B blocker to MU+	Brand/access value shifts waste, capital lockup or trust burden
C carriers	Buyer, seller, inventory, environment
ΔR missing structure	Provenance + condition + access + reconciliation layer
MU+ acceptance	Value retention, trust, access and waste outcomes improve
Market class	Governed luxury access and authenticated circular luxury
Decisive test	Operational field study

Reading. Closest to the discovery record; independence from the origin is the first test.

044 Hospitality

Culture beauty experience | position: **Strong structural fit**

X* state	Guest needs, staff capacity, time, room state, logistics and locality
Σ receiver schema	Booking/reservation state
B blocker to MU+	Guest delight shifts hidden labor or local burden
C carriers	Guest, staff, operator, locality
ΔR missing structure	End-to-end experience and workload orchestration Jefferson Rafael Rufino | 192
MU+ acceptance	Guest experience, staff wellbeing and economics improve
Market class	Hospitality operating systems
Decisive test	Property-level A/B evaluation

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

045 Travel and tourism

Culture beauty experience | position: **Constructive protocol**

X* state	Mobility, cost, safety, experience, local capacity and environment
Σ receiver schema	Itinerary/booking schema
B blocker to MU+	Visitor gain shifts congestion, environmental or resident burden
C carriers	Traveler, worker, resident, ecosystem
ΔR missing structure	Consequential itinerary/capacity controller
MU+ acceptance	Experience, resident value, worker conditions and environmental load improve
Market class	Destination orchestration
Decisive test	Destination pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

046 Art and cultural markets

Culture beauty experience | position: **Constructive protocol**

X* state	Creative work, provenance, rights, cultural meaning, scarcity and audience
Σ receiver schema	Price/ownership/engagement proxy
B blocker to MU+	Platform or collector gain shifts creator/community value
C carriers	Artist, audience, collector, community Jefferson Rafael Rufino | 193
ΔR missing structure	Rights/provenance/value-sharing architecture
MU+ acceptance	Creator income, access, provenance and cultural stewardship improve
Market class	Creator-rights and provenance markets
Decisive test	Marketplace field study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

047 Music and entertainment

Culture beauty experience | position: **Constructive protocol**

X* state	Creative contribution, rights, attention, audience value and platform economics
Σ receiver schema	Stream/view count
B blocker to MU+	Engagement gain shifts creator income or audience wellbeing
C carriers	Creators, audiences, platforms
ΔR missing structure	Contribution/provenance + value-distribution architecture
MU+ acceptance	Creator value and audience experience improve without exploitative load
Market class	Creator economy infrastructure
Decisive test	Platform experiment

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

048 Gaming and virtual worlds

Culture beauty experience | position: **Constructive protocol**

X* state	Player goals, time, identity, economy, safety and creator contribution
Σ receiver schema	Retention/spend metric
B blocker to MU+	Revenue shifts time, financial or social burden to players Jefferson Rafael Rufino | 194
C carriers	Players, creators, communities
ΔR missing structure	Cross-reality value and safety controller
MU+ acceptance	Fun, agency, creator value and safety improve
Market class	Virtual-world governance and healthy-economy systems
Decisive test	Platform experiment

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

049 Sports and performance

Culture beauty experience | position: **Strong structural fit**

X* state	Performance, health, training load, recovery, team dynamics and career horizon
Σ receiver schema	Win/score/output metric
B blocker to MU+	Performance gains shift injury or burnout burden
C carriers	Athlete, team, family, future self
ΔR missing structure	Load/recovery/career controller
MU+ acceptance	Performance, health, longevity and team value improve
Market class	Athlete operating systems
Decisive test	Prospective team study

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

050 Experience design and events

Culture beauty experience | position: **Constructive protocol**

X* state	Attention, emotion, logistics, accessibility, staff load and community impact
Σ receiver schema	Attendance/NPS/ticket revenue Jefferson Rafael Rufino | 195
B blocker to MU+	Experience gains shift queues, labor, exclusion or neighborhood burden
C carriers	Guests, staff, locality
ΔR missing structure	End-to-end experience-state orchestration
MU+ acceptance	Experience, access, worker load and local impact improve
Market class	Experience operating systems
Decisive test	Event A/B study

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

FAMILY 6 OF 10 · ADAPTERS 051 TO 060

Money markets organizations

Editor's overview. Closest to the origin business record; independence from it is the first test.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 79. Family 6: Money markets organizations.

No.	Domain	Current position	Frontier-market class
051	**Currency and monetary experience**	Constructive protocol	Settlement/liquidity infrastructure
052	**Payments and remittances**	Strong structural fit	Reconciliation payment rails
053	**Banking and liquidity**	Strong structural fit	Consequential banking infrastructure
054	**Credit and underwriting**	Constructive protocol	Next-generation underwriting
055	**Insurance and resilience**	Constructive protocol	Resilience-linked insurance
056	**Capital markets and investing**	Constructive protocol	Consequential investing infrastructure
057	**Private wealth and family capital**	Constructive protocol	Whole-capital wealth management
058	**Labor and talent markets**	Strong structural fit	Talent-capacity marketplaces
059	**Organizations and enterprises**	Strong structural fit	Enterprise operating systems
060	**Entrepreneurship and venture creation**	Origin-business fit	Frontier-market discovery and venture studio

051 Currency and monetary experience

Money markets organizations | position: **Constructive protocol**

X* state	Purchasing power, liquidity, settlement, access, trust and macro context
Σ receiver schema	Nominal unit/FX quote
B blocker to MU+	Nominal stability hides distributional or transaction burden
C carriers	Households, firms, intermediaries Jefferson Rafael Rufino | 196
ΔR missing structure	Consequential monetary-state and settlement architecture
MU+ acceptance	Access, settlement, purchasing stability and systemic resilience improve
Market class	Settlement/liquidity infrastructure
Decisive test	Historical + prospective policy-neutral system test

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

052 Payments and remittances

Money markets organizations | position: **Strong structural fit**

X* state	Amount, fees, FX, settlement time, access, fraud and recipient liquidity
Σ receiver schema	Successful transfer binary
B blocker to MU+	Speed or compliance shifts cost/friction to sender or receiver
C carriers	Sender, receiver, provider
ΔR missing structure	End-to-end transfer optimization with transparent provenance
MU+ acceptance	Cost, speed, safety and recipient value improve
Market class	Reconciliation payment rails
Decisive test	Transaction-level field test

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

053 Banking and liquidity

Money markets organizations | position: **Strong structural fit**

X* state	Deposits, credit, liquidity, capital, customer state and network exposures
Σ receiver schema	Product/account or institution-local balance sheet
B blocker to MU+	Risk shifts to customer, NBFI, taxpayer or future period
C carriers	Banks, customers, counterparties, public Jefferson Rafael Rufino | 197
ΔR missing structure	Network consequential balance sheet + capacity buffers
MU+ acceptance	Liquidity, access, resilience and customer outcomes improve
Market class	Consequential banking infrastructure
Decisive test	Stress test + pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

054 Credit and underwriting

Money markets organizations | position: **Constructive protocol**

X* state	Cashflow, assets, obligations, trajectory, capability and uncertainty
Σ receiver schema	Static score/category
B blocker to MU+	Risk reduction denies productive capacity or shifts cost elsewhere
C carriers	Borrower, lender, community
ΔR missing structure	Dynamic provenance/capacity underwriting
MU+ acceptance	Default risk and productive opportunity improve together
Market class	Next-generation underwriting
Decisive test	Prospective lending trial

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

055 Insurance and resilience

Money markets organizations | position: **Constructive protocol**

X* state	Hazard, exposure, prevention, coverage, recovery and incentives
Σ receiver schema	Loss probability/policy class
B blocker to MU+	Risk transfer leaves hazard untouched or creates moral hazard
C carriers	Policyholder, insurer, community Jefferson Rafael Rufino | 198
ΔR missing structure	Prevention + resilience + coverage architecture
MU+ acceptance	Losses, recovery time, affordability and insurer viability improve
Market class	Resilience-linked insurance
Decisive test	Pilot product evaluation

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

056 Capital markets and investing

Money markets organizations | position: **Constructive protocol**

X* state	Price, cashflow, externalities, network risk and long-horizon value
Σ receiver schema	Return/risk factor set
B blocker to MU+	Portfolio gain can externalize future or nonmarket cost
C carriers	Investor, firm, workers, public, environment
ΔR missing structure	Consequential asset ledger with carrier constraints
MU+ acceptance	Risk-adjusted return and protected carrier outcomes improve
Market class	Consequential investing infrastructure
Decisive test	Historical backtest + prospective paper portfolio

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

057 Private wealth and family capital

Money markets organizations | position: **Constructive protocol**

X* state	Financial, human, social, health and intergenerational capital
Σ receiver schema	Portfolio net worth
B blocker to MU+	Return maximization shifts life or family burden
C carriers	Client, family, future generations Jefferson Rafael Rufino | 199
ΔR missing structure	Whole-capital balance sheet + goals/capacity controller
MU+ acceptance	Wealth, resilience, health and intergenerational outcomes improve
Market class	Whole-capital wealth management
Decisive test	Longitudinal client evaluation

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

058 Labor and talent markets

Money markets organizations | position: **Strong structural fit**

X* state	Capability, workload, pay, health, learning and opportunity
Σ receiver schema	Job title/CV/credential
B blocker to MU+	Employer output shifts invisible effort or underutilizes capability
C carriers	Worker, family, employer
ΔR missing structure	Capability-state + workload + mobility architecture
MU+ acceptance	Productivity, pay, health and retention improve
Market class	Talent-capacity marketplaces
Decisive test	Workplace pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

059 Organizations and enterprises

Money markets organizations | position: **Strong structural fit**

X* state	Functions, dependencies, people, cash, knowledge and customer value
Σ receiver schema	Department/KPI structure
B blocker to MU+	Department success moves burden to another team/customer
C carriers	Workers, customers, suppliers Jefferson Rafael Rufino | 200
ΔR missing structure	Enterprise consequential graph + capacity placement
MU+ acceptance	Customer, worker, financial and resilience outcomes improve
Market class	Enterprise operating systems
Decisive test	Multi-team field experiment

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

060 Entrepreneurship and venture creation

Money markets organizations | position: **Origin-business fit**

X* state	Unmet burden, carrier, willingness to pay, build cost and adoption
Σ receiver schema	Existing market category/TAM
B blocker to MU+	No category exists because burden is hidden or dispersed
C carriers	Founder initially, then customer/system
ΔR missing structure	Mutual-Uptick blocker discovery + missing-capacity build
MU+ acceptance	Customer and surrounding carriers gain while venture captures part of released value
Market class	Frontier-market discovery and venture studio
Decisive test	Pilot venture with carrier ledger

Reading. Closest to the discovery record; independence from the origin is the first test.

FAMILY 7 OF 10 · ADAPTERS 061 TO 070

Technology information

Editor's overview. Digital telemetry makes parity tests cheapest here.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 80. Family 7: Technology information.

No.	Domain	Current position	Frontier-market class
061	**Artificial intelligence**	Strong constructive fit	AI reliability and provenance infrastructure
062	**Software systems**	Strong structural fit	Self-reconciling software infrastructure
063	**Cybersecurity**	Strong constructive fit	Autonomous cyber-defense infrastructure
064	**Data infrastructure**	Strong structural fit	Data reliability platforms
065	**Privacy**	Strong structural fit	Privacy-preserving infrastructure
066	**Digital identity**	Strong structural fit	Digital identity infrastructure
067	**Internet and communications**	Constructive protocol	Fidelity-aware communication infrastructure
068	**Media and information ecosystems**	Constructive protocol	High-fidelity media infrastructure
069	**Language and translation**	Strong structural fit	High-fidelity translation systems
070	**Knowledge and ontologies**	Strong constructive fit	Ontology infrastructure

061 Artificial intelligence

Technology information | position: **Strong constructive fit**

X* state	Model state, source reality, user intent, provenance, uncertainty and downstream action
Σ receiver schema	Prompt/context window/model output
B blocker to MU+	Model utility shifts verification and error burden to humans
C carriers	User, verifier, downstream system, compute
ΔR missing structure	Persistent schema/provenance layer + self-audit and escalation
MU+ acceptance	Utility, correctness, verification load and resource efficiency improve
Market class	AI reliability and provenance infrastructure
Decisive test	Sealed cross-model benchmark

Reading. A construction is both specifiable and testable now, often with existing digital telemetry.

062 Software systems

Technology information | position: **Strong structural fit**

X* state	Requirements, dependencies, state, users, infrastructure and technical debt
Σ receiver schema	Feature/ticket/local module schema
B blocker to MU+	Feature success shifts debt or failure to dependencies
C carriers	Developers, users, infrastructure
ΔR missing structure	Dependency/provenance graph + consequential release controller Jefferson Rafael Rufino | 202
MU+ acceptance	User value, reliability, maintainability and developer load improve
Market class	Self-reconciling software infrastructure
Decisive test	Repository-level prospective benchmark

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

063 Cybersecurity

Technology information | position: **Strong constructive fit**

X* state	Actual attack graph, identities, vulnerabilities, privileges and attacker state
Σ receiver schema	Defender inventory/rules/log view
B blocker to MU+	Blocking one path moves attacker or analyst burden elsewhere
C carriers	Systems, users, analysts, business continuity
ΔR missing structure	Self-updating attack schema + carrier prediction + safe containment/failover
MU+ acceptance	Loss, compromise, analyst load and downtime all fall
Market class	Autonomous cyber-defense infrastructure
Decisive test	Red-team sealed telemetry benchmark

Reading. A construction is both specifiable and testable now, often with existing digital telemetry.

064 Data infrastructure

Technology information | position: **Strong structural fit**

X* state	Datasets, lineage, semantics, permissions, quality and downstream uses
Σ receiver schema	Table/file/schema local view
B blocker to MU+	Cleaning one layer shifts ambiguity downstream
C carriers	Analysts, models, users, compliance Jefferson Rafael Rufino | 203
ΔR missing structure	Provenance graph + semantic reconciliation layer
MU+ acceptance	Quality, reuse, privacy and maintenance burden improve
Market class	Data reliability platforms
Decisive test	Enterprise data benchmark

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

065 Privacy

Technology information | position: **Strong structural fit**

X* state	Data state, purposes, consent, exposure, value and future misuse
Σ receiver schema	Consent checkbox or access-control list
B blocker to MU+	Utility shifts surveillance/risk burden to individuals
C carriers	Person, organization, future self
ΔR missing structure	Selective disclosure + provenance + minimization architecture
MU+ acceptance	Utility and organizational value improve while exposure falls
Market class	Privacy-preserving infrastructure
Decisive test	Field trial + attack testing

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

066 Digital identity

Technology information | position: **Strong structural fit**

X* state	Attributes, credentials, context, revocation, privacy and trust
Σ receiver schema	Single identifier/account
B blocker to MU+	Verification success creates overcollection or exclusion
C carriers	Person, verifier, issuer Jefferson Rafael Rufino | 204
ΔR missing structure	Selective-verification credential graph
MU+ acceptance	Verification, privacy, portability and access improve
Market class	Digital identity infrastructure
Decisive test	Cross-service pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

067 Internet and communications

Technology information | position: **Constructive protocol**

X* state	Topology, capacity, latency, content, trust and user needs
Σ receiver schema	Throughput/uptime metric
B blocker to MU+	Speed shifts attention, misinformation or energy burden
C carriers	Users, networks, platforms
ΔR missing structure	Consequential routing + fidelity/provenance layers
MU+ acceptance	Performance, reliability, trust and energy efficiency improve
Market class	Fidelity-aware communication infrastructure
Decisive test	Network/application experiment

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

068 Media and information ecosystems

Technology information | position: **Constructive protocol**

X* state	Claims, evidence, incentives, attention, creators and audiences
Σ receiver schema	Engagement/feed rank
B blocker to MU+	Attention gain shifts cognition or information quality burden
C carriers	Audience, creator, public discourse Jefferson Rafael Rufino | 205
ΔR missing structure	Claim provenance + quality + incentive reconciliation
MU+ acceptance	Reach, creator value and information quality improve
Market class	High-fidelity media infrastructure
Decisive test	Platform experiment

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

069 Language and translation

Technology information | position: **Strong structural fit**

X* state	Meaning, context, culture, pragmatics and uncertainty
Σ receiver schema	Word/token correspondence
B blocker to MU+	Literal fidelity shifts meaning or cultural nuance
C carriers	Speakers, institutions, models
ΔR missing structure	Semantic/provenance translation with ambiguity tracking
MU+ acceptance	Meaning fidelity, speed and cultural fit improve
Market class	High-fidelity translation systems
Decisive test	Blind human evaluation

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

070 Knowledge and ontologies

Technology information | position: **Strong constructive fit**

X* state	Entities, relations, provenance, incompatible schemas and uncertainty
Σ receiver schema	Single ontology/taxonomy
B blocker to MU+	Integration collapses distinctions or explodes complexity
C carriers	Researchers, AI, institutions Jefferson Rafael Rufino | 206
ΔR missing structure	Cross-schema translation + minimal sufficient ontology
MU+ acceptance	Interoperability and fidelity rise while complexity stays controlled
Market class	Ontology infrastructure
Decisive test	Cross-domain benchmark

Reading. A construction is both specifiable and testable now, often with existing digital telemetry.

FAMILY 8 OF 10 · ADAPTERS 071 TO 080

Earth infrastructure ecology

Editor's overview. Where established engineering and ecology literature already documents the mechanism.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 81. Family 8: Earth infrastructure ecology.

No.	Domain	Current position	Frontier-market class
071	**Energy and power grids**	Strong structural fit	Reconciliation grids and storage markets
072	**Water and irrigation**	Established adjacent evidence	Water reconciliation markets
073	**Food and agriculture**	Strong structural fit	Regenerative food infrastructure
074	**Supply chains and logistics**	Strong structural fit	Consequential supply-chain OS
075	**Manufacturing**	Strong structural fit	Regenerative manufacturing
076	**Waste and circular materials**	Strong structural fit	Circular-material markets
077	**Transportation and mobility**	Constructive protocol	Mobility orchestration
078	**Cities and urban systems**	Constructive protocol	Urban reconciliation platforms
079	**Climate and disaster resilience**	Constructive protocol	Climate resilience markets
080	**Ecology and biodiversity**	Established adjacent evidence	Biodiversity reconciliation markets

071 Energy and power grids

Earth infrastructure ecology | position: **Strong structural fit**

X* state	Generation, load, storage, network constraints, prices and reliability
Σ receiver schema	Local device efficiency or node KPI
B blocker to MU+	Efficiency moves load, congestion or rebound elsewhere
C carriers	Grid nodes, customers, storage, environment
ΔR missing structure	Consequential grid controller + capacity placement
MU+ acceptance	Reliability, affordability, emissions and congestion improve Jefferson Rafael Rufino | 207
Market class	Reconciliation grids and storage markets
Decisive test	Grid simulation + pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

072 Water and irrigation

Earth infrastructure ecology | position: **Established adjacent evidence**

X* state	Withdrawals, consumptive use, return flows, storage, aquifers and ecology
Σ receiver schema	Farm/project efficiency
B blocker to MU+	Local savings reduce return flow or increase consumption
C carriers	Downstream users, rivers, aquifers, ecosystems
ΔR missing structure	Basin-wide accounting + catchment + allocation capacity
MU+ acceptance	Farm value and basin availability/ecology improve
Market class	Water reconciliation markets
Decisive test	Basin holdout study

Reading. Adjacent literature already documents the central mechanism.

073 Food and agriculture

Earth infrastructure ecology | position: **Strong structural fit**

X* state	Yield, soil, water, inputs, nutrition, labor, market and climate
Σ receiver schema	Yield/acre or commodity price
B blocker to MU+	Yield gain shifts soil, water, labor or nutrition burden
C carriers	Farmer, consumer, soil, ecosystem
ΔR missing structure	Coupled regenerative production controller
MU+ acceptance	Yield/income, soil, water and nutrition improve Jefferson Rafael Rufino | 208
Market class	Regenerative food infrastructure
Decisive test	Multi-season farm trial

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

074 Supply chains and logistics

Earth infrastructure ecology | position: **Strong structural fit**

X* state	Inventory, demand, transport, suppliers, lead times and risk
Σ receiver schema	Node-level cost/service KPI
B blocker to MU+	Lean optimization moves inventory/risk downstream
C carriers	Suppliers, warehouses, customers
ΔR missing structure	Carrier-aware flow controller + buffer placement
MU+ acceptance	Service, working capital, resilience and labor improve
Market class	Consequential supply-chain OS
Decisive test	Historical + live pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

075 Manufacturing

Earth infrastructure ecology | position: **Strong structural fit**

X* state	Materials, energy, machines, labor, quality, maintenance and waste
Σ receiver schema	Unit cost/OEE
B blocker to MU+	Cost gain shifts maintenance, injuries or waste
C carriers	Workers, machines, environment, customers
ΔR missing structure	Closed-loop production and maintenance architecture
MU+ acceptance	Cost, quality, safety, uptime and waste improve
Market class	Regenerative manufacturing
Decisive test	Factory pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

076 Waste and circular materials

Earth infrastructure ecology | position: **Strong structural fit**

X* state	Material composition, location, contamination, residual value and logistics
Σ receiver schema	Waste tonnage/disposal category
B blocker to MU+	Disposal removes item from local ledger but not system
C carriers	Communities, environment, future production
ΔR missing structure	Material provenance + recapture + transformation capacity
MU+ acceptance	Waste, cost and virgin input demand fall while value recovery rises
Market class	Circular-material markets
Decisive test	Municipal/industrial pilot

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

077 Transportation and mobility

Earth infrastructure ecology | position: **Constructive protocol**

X* state	Trips, time, safety, access, energy, congestion and land use
Σ receiver schema	Vehicle throughput/speed
B blocker to MU+	Faster local travel creates congestion, emissions or exclusion
C carriers	Travelers, neighborhoods, environment
ΔR missing structure	Multimodal consequential mobility controller
MU+ acceptance	Access, time, safety, energy and neighborhood outcomes improve
Market class	Mobility orchestration
Decisive test	City corridor pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

078 Cities and urban systems

Earth infrastructure ecology | position: **Constructive protocol**

X* state	Housing, jobs, transport, health, utilities, safety and public space
Σ receiver schema	Agency-by-agency city data
B blocker to MU+	One department shifts burden to another neighborhood/system
C carriers	Residents, agencies, infrastructure
ΔR missing structure	City consequential digital twin + coordinated capacity
MU+ acceptance	Access, health, resilience, affordability and service improve
Market class	Urban reconciliation platforms
Decisive test	District pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

079 Climate and disaster resilience

Earth infrastructure ecology | position: **Constructive protocol**

X* state	Hazard, exposure, vulnerability, infrastructure, food, health and recovery
Σ receiver schema	Hazard forecast alone
B blocker to MU+	Preparedness in one sector leaves another exposed
C carriers	People, infrastructure, ecosystems, economy
ΔR missing structure	Anticipatory catchment + prepositioned capacity
MU+ acceptance	Mortality/risk, recovery, livelihoods and ecosystem resilience improve
Market class	Climate resilience markets
Decisive test	Prospective matched pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

080 Ecology and biodiversity

Earth infrastructure ecology | position: **Established adjacent evidence**

X* state	Species, habitats, flows, extraction, communities and climate
Σ receiver schema	Protected-area/local species metric
B blocker to MU+	Protection displaces extraction or pressure elsewhere
C carriers	Species, habitats, communities
ΔR missing structure	Landscape-scale leakage/carrier accounting + livelihoods
MU+ acceptance	Biodiversity and community outcomes improve
Market class	Biodiversity reconciliation markets
Decisive test	Landscape holdout study

Reading. Adjacent literature already documents the central mechanism.

FAMILY 9 OF 10 · ADAPTERS 081 TO 090

Physical microscopic formal

Editor's overview. Formal and computational testing should precede any field claim.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 82. Family 9: Physical microscopic formal.

No.	Domain	Current position	Frontier-market class
081	**Cell biology**	Regulated empirical frontier	Cell-state diagnostics and intervention platforms
082	**Molecular biology**	Regulated empirical frontier	Molecular design infrastructure
083	**Nanotechnology**	Regulated empirical frontier	Safe-by-design nanotechnology
084	**Chemistry and reaction systems**	Strong structural fit	Closed-loop chemistry
085	**Materials science**	Strong structural fit	Self-monitoring/regenerative materials
086	**Classical mechanics and control**	Formal + computational fit	Advanced sensing/control/recovery systems
087	**Thermodynamics and nonequilibrium systems**	Strong structural fit	Heat recovery and regenerative process markets
088	**Electromagnetism and circuits**	Formal + computational fit	Smart power-electronics/control systems
089	**Quantum systems**	Hard experimental frontier	Quantum sensing/control systems
090	**Pure mathematics and formal systems**	Formal frontier	Formal-schema compilers and theorem infrastructure

081 Cell biology

Physical microscopic formal | position: **Regulated empirical frontier**

X* state	Signaling, organelles, metabolism, damage, repair and cell-state transitions
Σ receiver schema	Single pathway/marker
B blocker to MU+	Pathway correction displaces stress to another process
C carriers	Organelles, pathways, neighboring cells
ΔR missing structure	Multi-state cellular controller + capacity targeting
MU+ acceptance	Target function improves without compensatory cellular damage
Market class	Cell-state diagnostics and intervention platforms
Decisive test	In-vitro perturbation study

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

082 Molecular biology

Physical microscopic formal | position: **Regulated empirical frontier**

X* state	Molecules, conformations, binding networks, concentrations and kinetics
Σ receiver schema	Single interaction/target
B blocker to MU+	Target binding shifts network or toxicity burden
C carriers	Molecules, pathways, host system
ΔR missing structure	Reaction/network state model + off-target carrier control
MU+ acceptance	Desired molecular effect rises while off-target burden falls
Market class	Molecular design infrastructure
Decisive test	Bench experiments

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

083 Nanotechnology

Physical microscopic formal | position: **Regulated empirical frontier**

X* state	Particle properties, surfaces, transport, environment and biological interaction
Σ receiver schema	Particle spec alone
B blocker to MU+	Performance shifts toxicity/persistence burden
C carriers	Cells, environment, users
ΔR missing structure	Lifecycle and interaction-aware nano design
MU+ acceptance	Function improves while toxicity and persistence fall
Market class	Safe-by-design nanotechnology
Decisive test	Bench + environmental tests

Reading. Evidence must come from regulated trials or audits; this entry is research architecture only.

084 Chemistry and reaction systems

Physical microscopic formal | position: **Strong structural fit**

X* state	Species, reaction network, kinetics, energy, byproducts and separation
Σ receiver schema	Target yield/selectivity
B blocker to MU+	Yield gain shifts energy/byproduct/separation burden
C carriers	Reactor, environment, downstream process
ΔR missing structure	Consequential reaction-network optimization + recovery loops
MU+ acceptance	Yield, energy, waste and safety improve
Market class	Closed-loop chemistry
Decisive test	Reactor experiments

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

085 Materials science

Physical microscopic formal | position: **Strong structural fit**

X* state	Microstructure, defects, stress, temperature, lifecycle and manufacturing
Σ receiver schema	Bulk property spec
B blocker to MU+	Strength gain shifts brittleness, weight or recyclability
C carriers	Material, structure, environment
ΔR missing structure	Defect-aware multiproperty design + recovery architecture
MU+ acceptance	Performance, durability, mass, cost and recyclability improve
Market class	Self-monitoring/regenerative materials
Decisive test	Lab characterization

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

086 Classical mechanics and control

Physical microscopic formal | position: **Formal + computational fit**

X* state	Physical state, dynamics, sensors, actuators and disturbance
Σ receiver schema	Partial state observation/local control objective
B blocker to MU+	Control success shifts energy, heat or another state variable
C carriers	Plant, actuator, environment
ΔR missing structure	Representation-aware full-state controller + regenerative capacity
MU+ acceptance	Tracking, stability, energy and wear improve together
Market class	Advanced sensing/control/recovery systems
Decisive test	Physical bench experiment

Reading. Amenable to formal and computational testing before any field work.

087 Thermodynamics and nonequilibrium systems

Physical microscopic formal | position: **Strong structural fit**

X* state	Energy, entropy, gradients, reservoirs, flows and constraints
Σ receiver schema	Local efficiency/temperature metric
B blocker to MU+	Local efficiency moves entropy production/heat elsewhere
C carriers	Reservoirs, environment, components
ΔR missing structure	Whole-boundary energy/exergy and recovery architecture
MU+ acceptance	Useful work rises while irreversible losses and collateral loads fall
Market class	Heat recovery and regenerative process markets
Decisive test	Physical experiment

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

088 Electromagnetism and circuits

Physical microscopic formal | position: **Formal + computational fit**

X* state	Fields, voltages, currents, topology, storage and losses
Σ receiver schema	Local component state
B blocker to MU+	Local regulation moves loss or instability to another branch
C carriers	Circuit elements, sources, loads
ΔR missing structure	Full-network state estimation + capacity/recovery placement
MU+ acceptance	Stability, efficiency, reliability and component stress improve
Market class	Smart power-electronics/control systems
Decisive test	Bench circuit experiment

Reading. Amenable to formal and computational testing before any field work.

089 Quantum systems

Physical microscopic formal | position: **Hard experimental frontier**

X* state	Quantum state, observables, measurement, control and decoherence
Σ receiver schema	Accessible observable set
B blocker to MU+	Measurement/control choice changes information and disturbance
C carriers	Quantum system, apparatus, environment
ΔR missing structure	Constraint-respecting measurement/control schema + capacity
MU+ acceptance	Task fidelity improves without unacceptable decoherence/resource burden
Market class	Quantum sensing/control systems
Decisive test	Laboratory quantum experiment

Reading. Experiments are hard to design cleanly; identification is the first problem.

090 Pure mathematics and formal systems

Physical microscopic formal | position: **Formal frontier**

X* state	Objects, relations, axioms, language, proofs and translations
Σ receiver schema	Chosen signature/type system/quotient
B blocker to MU+	Representation collapses distinctions or expands proof complexity
C carriers	Proof system, translator, solver
ΔR missing structure	Minimal sufficient schema preserving required relations
MU+ acceptance	Fidelity rises while ambiguity and proof/representation cost fall
Market class	Formal-schema compilers and theorem infrastructure
Decisive test	Machine-checked theorem suite

Reading. Formal results are needed; metaphor is not enough.

FAMILY 10 OF 10 · ADAPTERS 091 TO 100

Frontier illicit cosmic

Editor's overview. Hard engineering and open-by-definition territory; guardrails are strictest.

This family contains 10 named adapters. Each is a one-page construction brief: native state, schema, blocker, carrier, missing capacity, Mutual-Uptick condition, candidate market and decisive next test.

Table 83. Family 10: Frontier illicit cosmic.

No.	Domain	Current position	Frontier-market class
091	**Statistics and causal inference**	Strong structural fit	Causal reliability infrastructure
092	**Logic and reasoning systems**	Formal frontier	Reasoning infrastructure
093	**Geography and territorial systems**	Constructive protocol	Geospatial coordination infrastructure
094	**Informal economy**	Constructive protocol	Formalization bridges and microenterprise infrastructure
095	**Illicit and black markets**	Safety-governed frontier	Anti-fraud, provenance, treatment, legal-substitute and prevention markets
096	**Orbital and space economy**	Hard engineering frontier	Orbital infrastructure and traffic coordination
097	**Extraterrestrial settlement**	Hard engineering frontier	Off-world life-support, autonomy and governance systems
098	**Astrobiology and biosignatures**	Hard scientific frontier	Next-generation biosignature instrumentation
099	**Planetary systems and stewardship**	Hard engineering frontier	Planetary stewardship infrastructure
100	**Unknown and not-yet-named realities**	Open by definition	Frontier-market discovery itself

091 Statistics and causal inference

Frontier illicit cosmic | position: **Strong structural fit**

X* state	Data-generating process, sampling, measurement, confounding and uncertainty
Σ receiver schema	Chosen model/estimand
B blocker to MU+	Local fit hides transportability or selection bias
C carriers	Decision makers, future samples, affected groups
ΔR missing structure	Provenance-aware multi-model causal state + identifiability guardrails
MU+ acceptance	Predictive/causal validity improves without hidden subgroup harm
Market class	Causal reliability infrastructure
Decisive test	Simulation + multi-dataset benchmark

Reading. The structural pattern is well documented in the literature; the priority is a sealed carrier-prediction test.

092 Logic and reasoning systems

Frontier illicit cosmic | position: **Formal frontier**

X* state	Premises, inference rules, contradictions, uncertainty and goals
Σ receiver schema	Single logical calculus
B blocker to MU+	Consistency in one calculus loses expressivity/context elsewhere
C carriers	Reasoner, downstream decision
ΔR missing structure	Multi-logic translation + contradiction provenance
MU+ acceptance	Validity, expressivity and computational tractability improve
Market class	Reasoning infrastructure
Decisive test	Formal benchmark

Reading. Formal results are needed; metaphor is not enough.

093 Geography and territorial systems

Frontier illicit cosmic | position: **Constructive protocol**

X* state	People, ecosystems, infrastructure, flows and administrative boundaries
Σ receiver schema	Jurisdiction/map boundary
B blocker to MU+	Administrative optimization ignores cross-border flows
C carriers	Border communities, watersheds, networks
ΔR missing structure	Flow-based territorial state model
MU+ acceptance	Access, resilience and cross-boundary fairness improve
Market class	Geospatial coordination infrastructure
Decisive test	Regional pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

094 Informal economy

Frontier illicit cosmic | position: **Constructive protocol**

X* state	Real work, exchange, trust, risk and household needs outside formal records
Σ receiver schema	Formal registry/tax/business schema
B blocker to MU+	Productive activity remains invisible or excluded
C carriers	Workers, households, state
ΔR missing structure	Low-friction recognition, protection and access architecture
MU+ acceptance	Income, safety, access and compliance improve
Market class	Formalization bridges and microenterprise infrastructure
Decisive test	Field pilot

Reading. The mapping is plausible and a construction can be specified; evidence is mostly protocol-ready.

095 Illicit and black markets

Frontier illicit cosmic | position: **Safety-governed frontier**

X* state	Hidden demand, supply, coercion, enforcement, prices and harm
Σ receiver schema	Official market data that excludes hidden exchange
B blocker to MU+	Profit and access externalize violence, exploitation or public harm
C carriers	Victims, communities, lawful firms, institutions
ΔR missing structure	Lawful substitutes, prevention, provenance, treatment/rehabilitation and targeted enforcement
MU+ acceptance	Harm and illicit profitability fall while legitimate access/opportunity rises
Market class	Anti-fraud, provenance, treatment, legal-substitute and prevention markets
Decisive test	Independent harm-reduction/public-safety evaluation

Reading. Safety governance sets the boundary of any trial. For illicit markets the constructive target is lawful substitution, prevention, provenance, treatment and victim support. This book provides no operational assistance for crime or evasion.

096 Orbital and space economy

Frontier illicit cosmic | position: **Hard engineering frontier**

X* state	Spacecraft, debris, spectrum, energy, logistics and operator incentives
Σ receiver schema	Mission-local success metric
B blocker to MU+	Mission gain shifts debris/collision/spectrum burden
C carriers	Other spacecraft, operators, orbital environment
ΔR missing structure	Orbital consequential ledger + shared capacity
MU+ acceptance	Mission value, safety, debris and resource efficiency improve
Market class	Orbital infrastructure and traffic coordination
Decisive test	Simulation + mission pilot

Reading. Physical engineering limits make construction difficult and costly; feasibility is the first question.

097 Extraterrestrial settlement

Frontier illicit cosmic | position: **Hard engineering frontier**

X* state	Life support, energy, materials, health, governance and closed ecology
Σ receiver schema	Earth-derived subsystem silos
B blocker to MU+	Local subsystem success threatens another life-support loop
C carriers	Crew, machines, habitat ecology
ΔR missing structure	Closed-loop consequential state + autonomous capacity construction
MU+ acceptance	Survival, health, resource closure and social stability improve
Market class	Off-world life-support, autonomy and governance systems
Decisive test	Analog habitat + mission tests

Reading. Physical engineering limits make construction difficult and costly; feasibility is the first question.

098 Astrobiology and biosignatures

Frontier illicit cosmic | position: **Hard scientific frontier**

X* state	Unknown life chemistries, environments, signals and contamination risks
Σ receiver schema	Earth-centric life schema
B blocker to MU+	Narrow schema misses unfamiliar life or creates false positives
C carriers	Scientific program, environment, future missions
ΔR missing structure	Plural biosignature schema + provenance/contamination control
MU+ acceptance	Detection sensitivity and specificity improve without contamination
Market class	Next-generation biosignature instrumentation
Decisive test	Blind benchmark + mission data

Reading. Requires new domain science, not only a mapping.

099 Planetary systems and stewardship

Frontier illicit cosmic | position: **Hard engineering frontier**

X* state	Atmosphere, hydrology, geology, biosphere, resources and settlements
Σ receiver schema	Sector-local resource model
B blocker to MU+	Extraction/settlement shifts planetary burdens
C carriers	Settlements, ecosystems, future generations
ΔR missing structure	Closed-loop planetary resource and restoration architecture
MU+ acceptance	Human value and planetary resilience improve
Market class	Planetary stewardship infrastructure
Decisive test	Earth analog + simulation

Reading. Physical engineering limits make construction difficult and costly; feasibility is the first question.

100 Unknown and not-yet-named realities

Frontier illicit cosmic | position: **Open by definition**

X* state	Any newly observed substrate, scale, agent, value dimension or exchange mode
Σ receiver schema	No adequate schema exists yet
B blocker to MU+	Unrepresented state is invisible until consequences accumulate
C carriers	Unknown until carrier tracing identifies it
ΔR missing structure	Instantiate M_d, define schema, measure gap, trace carrier, construct capacity
MU+ acceptance	All material carriers in the new domain cross positive consequential thresholds
Market class	Frontier-market discovery itself
Decisive test	Freeze kernel before learning outcomes; then holdout/replicate

Reading. No schema exists yet; the kernel is applied to learn one.

PART VIII

Practice

Four worked audits, a field guide with templates, the strongest objections and a catalogue of ways the law gets misused.

CHAPTER 31

Four Worked Audits

The earlier chapters explain the kernel; this one runs it. Each audit below takes a familiar situation and walks through the questions in order: boundary, schema, carriers, hidden compensation, RVG, construction, MU+. **All numbers are hypothetical, constructed for teaching.** They are not drawn from any real hospital, basin, grid or company, and they should not be used as estimates. What matters is the shape of the ledger.

> **How to read the carrier charts**
>
> Each bar is a carrier's change relative to baseline in its own native outcome, with positive meaning better for that carrier. Amber or red bars show the world after the local optimisation only; teal bars show the world after capacity construction. A kernel pass requires every bar to be positive by a preregistered margin, not just the biggest ones.

Audit 1: shortening hospital stays

The local success. A hospital reduces bed-days per case by 15% through earlier discharge protocols. Its dashboard turns green.

Boundary and schema. S is the hospital episode; G is the episode plus the following 30 days of the household, the community nursing service and the patient. The hospital's schema records "discharged home". It has no field for "family member now provides eleven unpaid hours of care a week".

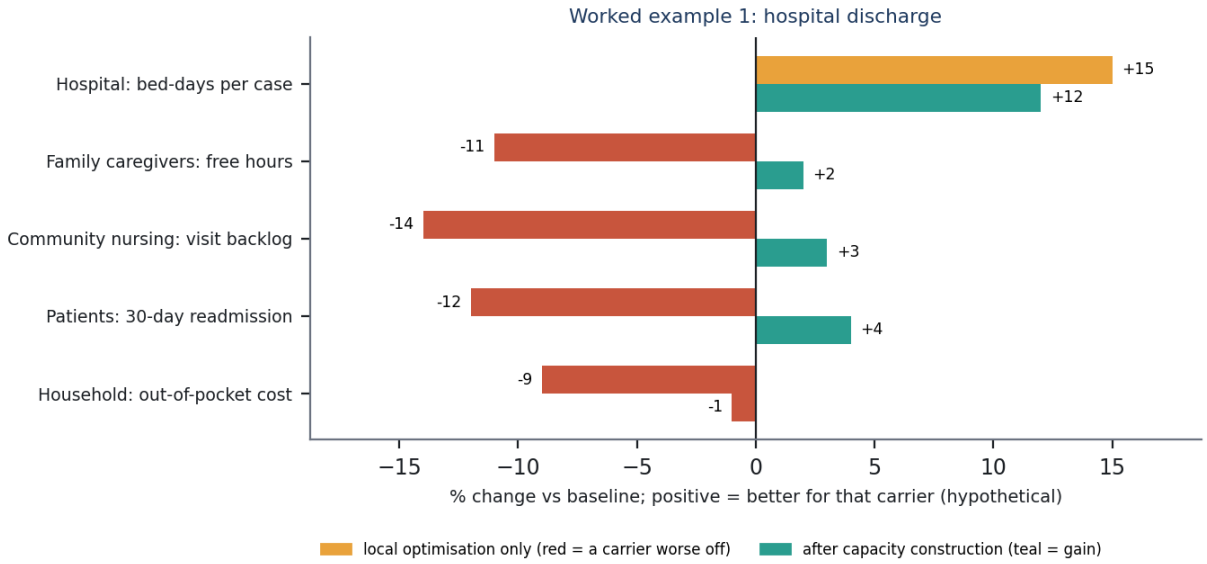

Figure 33. Audit 1 (hypothetical numbers). The hospital gains 15% but four other carriers lose. The binding carrier is the family. Constructing a discharge navigator and a respite pool turns the family, nursing service and patients positive at the cost of a smaller hospital gain.

Table 84. Kernel steps for Audit 1.

Step	Question	Finding in the worked example
Schema gap	Does the record capture post-discharge burden?	No: Gσ high between the household's real state and the recognised state
Carrier	Who holds the displaced state?	Family caregivers (hours), community nursing (backlog)
Hidden compensation	What keeps the system stable?	Unpaid family caregiving; stable only while the family can sustain it

Step	Question	Finding in the worked example
RVG	Is burden accumulating?	Caregiver hours inflow exceeds respite absorption; stock rising
Construction	What capacity at C*?	Discharge navigator, respite pool, nursing triage slots
MU+	Does every carrier gain?	Hospital +12%, family +2%, nursing +3%, patients +4%, household −1%: **fails on the household**

Result. The first construction fails MU+ narrowly: household out-of-pocket cost is slightly worse. The kernel does not declare victory. It reopens the ledger, finds the household as the new binding carrier and specifies the next build, for example a transport and equipment subsidy funded from the hospital's own bed-day savings. That is the recurrence in practice.

Audit 2: saving water on the farm

The local success. Adopting farms install efficient irrigation: yield per cubic metre rises 20% and withdrawals fall 15%. Project-level efficiency reports look excellent.

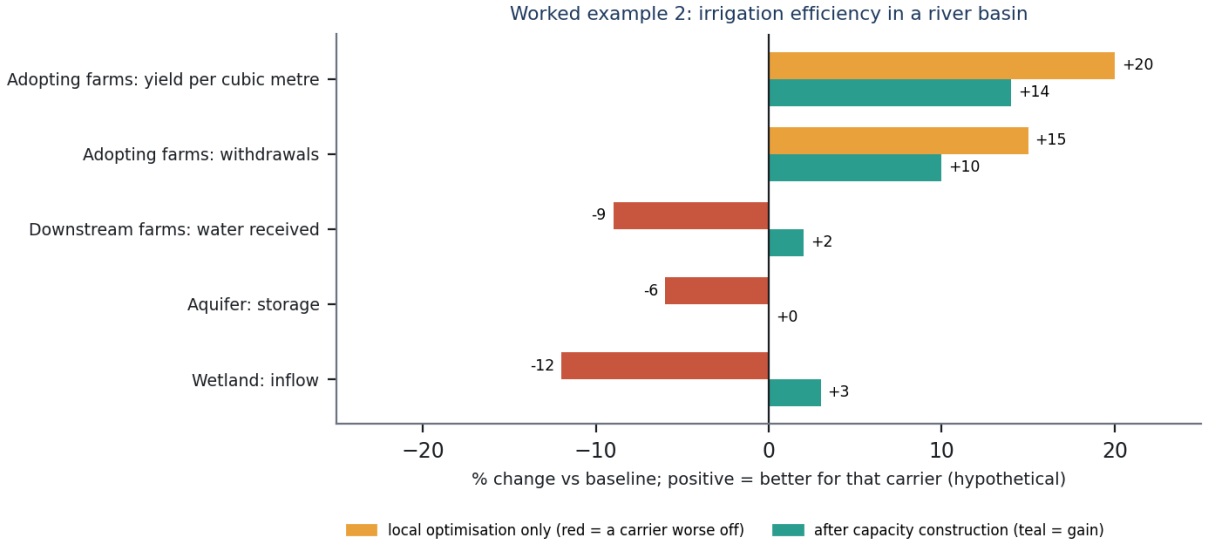

Figure 34. Audit 2 (hypothetical numbers). Farm-level efficiency improves while return flows to the river fall; downstream farms, the aquifer and a wetland lose. Basin-aware allocation, return-flow accounting and caps keep most of the farm gain and turn the others non-negative.

Boundary and schema. S is the farm or project; G is the basin: withdrawals, consumptive use, return flows, storage, downstream users and ecosystems. The farm's schema measures "efficiency" as output per unit withdrawn, so a reduction in return flow, which downstream users relied on, is invisible. The literature the source cites describes exactly this pattern as the irrigation efficiency paradox: savings at the farm that do not become savings in the basin, and rebound in consumption.

Hidden compensation. Groundwater is the missing buffer: when river water thins, downstream farms pump more, and the aquifer pays. **Construction.** Return-flow accounting, basin-level allocation with caps, and storage that preserves downstream value. **Retest.** Adopting farms keep +14% yield per cubic metre, downstream farms recover to +2%, the aquifer to zero change and the wetland to +3%.

What would make this a null? If measured return flows were negligible, because for instance irrigation water mostly drains to a saline sink no one else can use, BDI would be near zero and the kernel would return NO ACTIVATION. That case is real, and the law has to be able to say so.

Audit 3: shaving the peak on a power grid

The local success. A demand-response programme cuts peak-hour load by 8% by pre-cooling and delaying appliances.

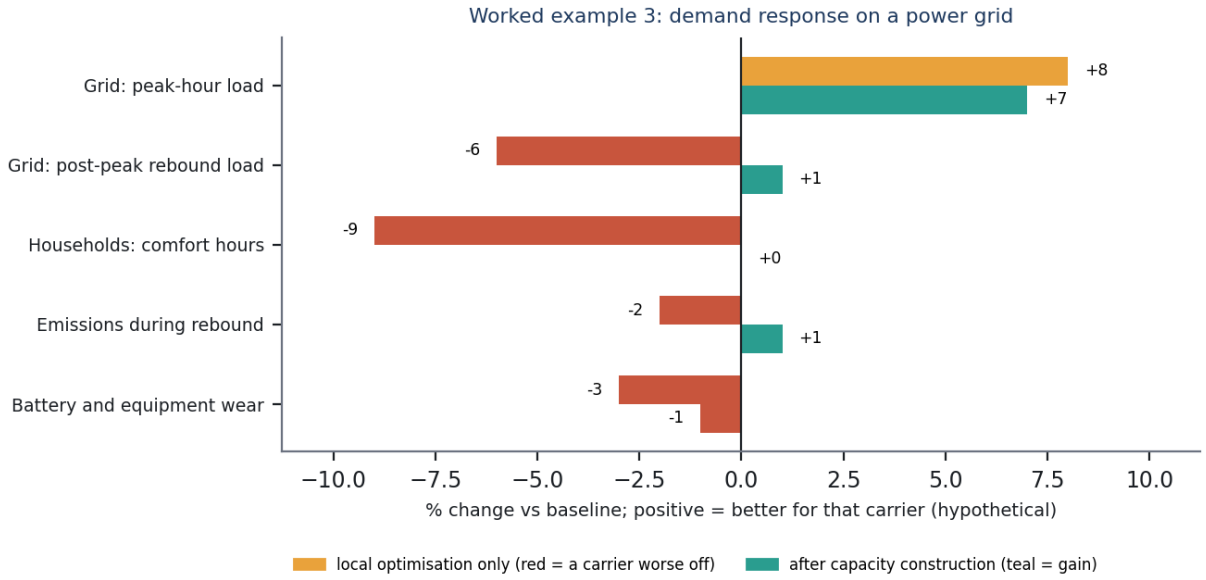

Figure 35. Audit 3 (hypothetical numbers). The peak falls but a rebound appears afterwards, with comfort and equipment costs. Storage and staggered release remove most of the rebound while keeping most of the peak reduction.

Boundary and schema. S is the peak window; G adds the following hours, household comfort, emissions and equipment. The programme's schema counts "kW shed". It has no line for kW returned two hours later. A study cited in the source on smart thermostat co-optimisation describes peak shaving with rebound mitigation as a design problem rather than a footnote. **Carrier.** The post-peak period is the receiving carrier, in time rather than space.

Construction and retest. Thermal or battery storage, staggered release and envelope efficiency together keep a 7% peak reduction while cutting rebound to near zero and restoring comfort hours. The remaining negative is equipment wear, a small price that must be priced and monitored rather than ignored.

Audit 4: an AI-assisted support workflow

The local success. An AI assistant drafts replies, and requesters resolve 35% more tickets per hour.

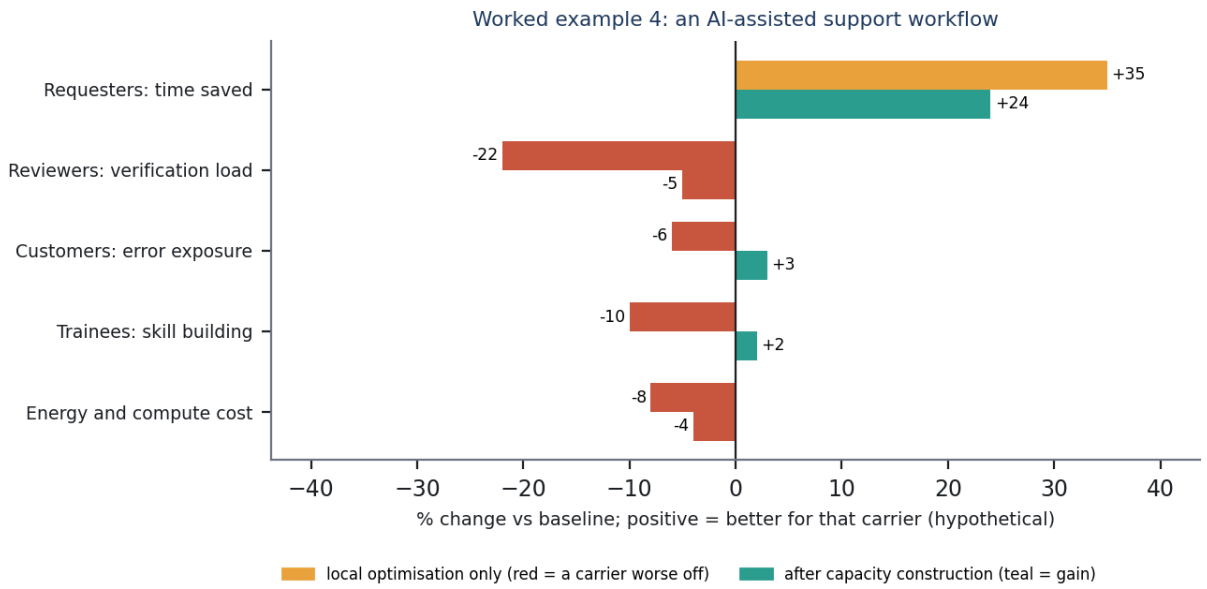

Figure 36. Audit 4 (hypothetical numbers). Requesters gain time but reviewers carry a new verification load, customers face more error exposure and trainees learn less. Provenance, confidence-based escalation and structured feedback recover most of the loss while trimming the headline gain.

Boundary and schema. S is the drafting step; G adds review, customers, learning and compute. The workflow's schema counts "tickets closed". **Hidden compensation.** Reviewers quietly check outputs and fix subtle errors; their time is not on the productivity line. **Construction.** A provenance layer that shows sources, escalation only when confidence is low, and structured feedback that lets novices learn from corrections. **Retest.** Requesters keep +24%, reviewer load falls from −22% to −5%, customers recover to +3% and trainees to +2%.

What the four audits share

In each case the local gain survives the audit at a reduced size. This is the typical shape: the kernel does not usually stop a good idea; it resizes it and reveals what must be built beside it. In none of the four did the first construction clear every gate, and in the first it failed narrowly. That is also typical, and is why the retest is compulsory.

CHAPTER 32

A Field Guide to Running an Audit

This chapter turns the kernel into ten steps that a small team can run in a few weeks on a real decision, with templates for the ledgers. It is practical guidance for research and management settings. It does not replace domain expertise, and in clinical, legal, financial-regulatory or safety-critical settings the output is an input to qualified professionals, not a decision.

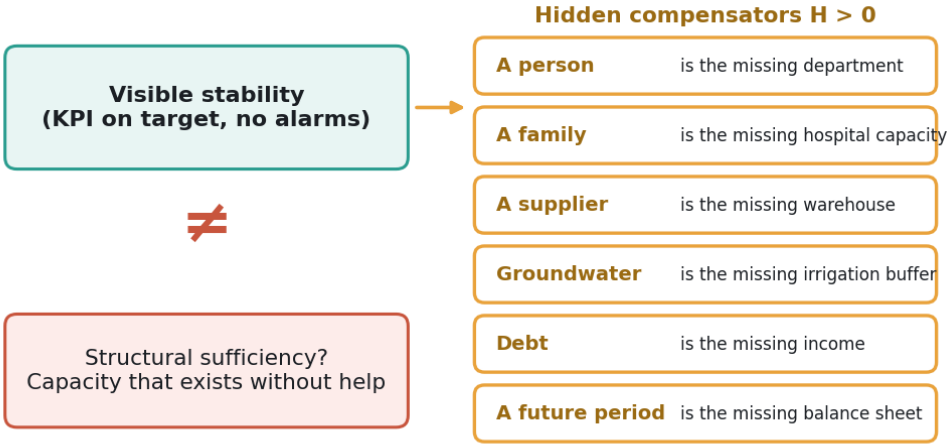

Figure 37. A reminder of what the audit is hunting for: the hidden compensators that make stability look like sufficiency.

The ten steps

Table 85. The ten-step audit.

#	Step	Output	Common mistake
1	Name the decision and its local objective	One sentence: who optimises what	Choosing a decision too vague to test
2	Declare G, horizon, inclusion and materiality rules	Dated boundary memo	Widening G after seeing results
3	State the comparator a_0	Baseline definition	Using "do nothing" when practice differs
4	List candidate carriers and their native units	Carrier register	Merging units into a single score
5	Measure the schema gap	Gσ with method	Measuring only after the outcome is known
6	Estimate displacement and its identification strategy	D table, or UNKNOWN	Descriptive deltas presented as causal
7	Hunt for hidden compensation	H list with test	Treating stability as sufficiency
8	Compute RVG per carrier	Inflow, absorption, stock	Looking only at levels, not rates
9	Design and cost the construction at C*	Capex, opex, side effects	Counting routing as construction
10	Retest and run the MU+ gate	Gate sheet; final output	Declaring success on an average

Template 1: carrier ledger

Table 86. Carrier ledger. One row per protected carrier; no cross-row sums.

Carrier	Native unit	Baseline	After action	Change	Lower bound	ε	Pass?

Template 2: friction ledger

Table 87. Friction ledger. Keep hours, money, energy and trust in separate rows.

Friction	Native unit	Who bears it	Avoidable?	Evidence	Cost of removal

Template 3: preregistration sheet

Table 88. Preregistration sheet.

Field	Content
Decision and local objective	...
G, horizon, inclusion rule, materiality scale	...
Comparator a_0 and information-parity cell	...
Carriers G_m, value and safety functions, ε_j	...
Identification strategy for D	...
Null cases chosen in advance	...
Stopping rules: NO ACTIVATION, UNKNOWN, NO FEASIBLE MU+	...
Sealed outcomes and unblinding date	...
Who replicates, and with what data and code	...

Time and cost: a realistic expectation

A first pass on a modest decision, with data already in hand, can usually be done by two people in two to four weeks: one on boundary and carriers, one on data and identification. Carrier hunting and hidden-compensation tests take the longest because they involve talking to people and observing work. Construction design and costing takes longer where physical capacity is needed. The estimate is the edition's planning judgement, not a measured figure.

When to stop early

- BDI within tolerance after step 6: return NO ACTIVATION and stop.
- Carrier or counterfactual not identifiable: return UNKNOWN and specify the measurement.
- Every admissible construction fails a hard safety or legal constraint: return NO FEASIBLE MU+.

CHAPTER 33

Objections and Replies

A book that wants to be tested should publish the best objections to itself. Twelve follow, each with the book's reply and, where it applies, this edition's view.

"This is just externalities with new names."

Partly, and the book says so. Externality theory, critical systems heuristics and telecoupling are close ancestors. The claim is about the complete sequence as one operator with a strict acceptance rule. The way to test the claim is to give a rival framework the same information and budget and see whether it matches the full sequence (Chapter 26).

"BDI is non-negative by construction, so it proves nothing."

Correct, and the book's own formal-closure notes say it. BDI is a defined quantity. The empirical claim is that, with a preregistered boundary, BDI predicts where interventions pay. Chapter 21 shows both the tautology and what has to be added to make it informative.

"If you can always widen the boundary, you will always find a loser."

Only if G may be widened after seeing outcomes. The kernel requires G, horizon and materiality to be declared first, and it requires null cases and an UNKNOWN output.

"Mutual Uptick is impossible. Some trade-offs are real."

Then the correct output is NO FEASIBLE MU+, and the book says so. MU+ is an acceptance standard, not a promise that it can be met. It makes the trade-off explicit and carrier-specific instead of letting an average hide it.

"Native units make everything incomparable."

They make comparison explicit. Where a decision requires a trade-off, the kernel allows preregistered weights with sensitivity analysis. What it forbids is a silent exchange rate.

"The tests are mostly open, so the law is unproven."

Agreed, and the claim ledger says the same: PROPOSED LAW / RESEARCH PROGRAMME. The register is built to show exactly what is open.

"Simulation results were tuned after a failure."

The source says so for the catch-basin run and classes it as exploratory. This edition adds its own toy results with negatives retained (Chapter 21). Release of generator, seeds and code is the remedy.

"One person's life record cannot ground a general law."

Nor does the book say it can. Index Case 001 is discovery provenance. The cross-domain claim rests on independent phenomenon evidence and, eventually, prospective tests.

"The 100-domain atlas is overreach."

It would be, if it were presented as 100 validations. It is explicitly a construction brief and hypothesis generator, and entry 100 is "open by definition".

"Fundamental physics and Millennium Prize claims appear in the corpus."

They are retained as author-supplied hypotheses. The claim ledger marks them NOT ESTABLISHED, and branch B18 is a deliberate non-pass. This edition makes no such claims.

"Isn't this a new management fad?"

Fads resist testing. This one specifies falsifiers, kill tests and an information-parity design that could embarrass it.

"Who funds the capacity?"

The most important practical question, and the one the strata toy deliberately leaves open. Under MU+ the funding carrier must itself gain by a preregistered bound.

CHAPTER 34

Ten Ways to Misuse the Law

A framework with a moral flavour invites misuse. Each item below is a pattern worth watching for, in others and in oneself.

Table 89. Ten misuse patterns.

Misuse	What it looks like and the corrective
Boundary hunting	Widening G after the fact until a villain appears. Declare G first.
Carrier blaming	Treating a carrier as a culprit. Carriers are where state lands, not who caused it.
Intent inference	Reading a factual contradiction as deception. The kernel keeps these separate.
Unit laundering	Converting everything to one currency to make a pleasing score. Native units only.
Average comfort	Declaring success because the mean rose. MU+ is per carrier.
Routing as construction	Moving burden to a carrier with spare capacity and calling it a fix.
Never-null auditing	An audit that always finds displacement. BDI near zero must be a legitimate answer.
Phenomenon upgrading	Citing a documented phenomenon as a kernel validation. The evidence grammar forbids it.
Cargo-cult universality	Applying the same action everywhere. Universality means the same grammar, not the same action.
Using hardship as a sales funnel	Treating unresolved burden as proof of profitable demand. Willingness to pay, legality, ethics and execution are separate gates.

A short personal checklist

- Did I declare the boundary before looking at outcomes?
- Could this audit have returned nothing? Show the null case.
- Is there a carrier who has not been asked?
- Have I confused a documented phenomenon with a test of the kernel?
- Who pays for the construction, and do they gain?

A last word on tone

The law's vocabulary of carriers, burden and displacement can be applied to people. When it is, the people on the receiving end are not "sinks". They are the reason the audit exists. A good audit makes their situation legible to the system that produced it, and then builds something so that it no longer depends on their silent absorption.

CHAPTER 35

Concept Cards

One card per idea, in a fixed format: what it is, the formula, the question to ask, the typical failure and a one-line example. They are written to be photocopied and pinned beside a whiteboard.

01 Schema gap (Gσ)

What it is. The distance between what is the case and what a receiver recognises.

Formula. Gσ = δ(X*, X̂), normalised JSD by default

Ask. What does the receiving system literally have no field for?

Typical failure. Measuring the gap after the outcome is known.

Example. A benefits form with no category for irregular income.

02 Friction (Φ)

What it is. The incremental cost of bridging a mismatch, in native units.

Formula. Φ = causal, incremental, native-unit cost of representation state

Ask. Who is doing the re-explaining, and in which unit does it hurt?

Typical failure. Converting hours, trust and money into one number.

Example. Four office visits to prove one fact.

03 Boundary divergence (BDI)

What it is. How much worse the locally best action is, judged by the wider boundary.

Formula. BDI = J_G(a*_S) − J_G(a*_G) ≥ 0

Ask. If this action doubled, who else would notice?

Typical failure. Widening G after seeing results.

Example. A farm saves water; the river runs thin.

04 Counterfactual displacement (D)

What it is. What moved, to whom and when, relative to a declared comparator.

Formula. $D = E[U \mid do(a)] - E[U \mid do(a_0)]$

Ask. Against what baseline, and how is it identified?

Typical failure. Reporting descriptive deltas as causal.

Example. Discharge shortens stays; caregiver hours rise.

05 Carrier (C)

What it is. The thing that holds displaced state: person, account, aquifer, future period.

Formula. C* = argmax w·ρ, in native units

Ask. Who or what is paying that the dashboard cannot see?

Typical failure. Treating a carrier as a culprit.

Example. A reviewer quietly checking every AI draft.

06 Hidden compensation (H)

What it is. An unseen contributor that makes stability look like sufficiency.

Formula. observed stability ≠ structural sufficiency

Ask. What would fail if this person, buffer or period were removed?

Typical failure. Never testing the removal, even in simulation.

Example. Groundwater as the missing irrigation buffer.

07 Reconciliation Velocity Gap (RVG)

What it is. Burden inflow minus realised absorption, per carrier.

Formula. RVG = ι − α, α ≤ R

Ask. Is the stock growing even if the level looks safe?

Typical failure. Reading levels instead of rates.

Example. Caregiver hours rising faster than respite capacity.

08 Capacity construction (IAMF-P)

What it is. Building absorption at the binding carrier, or repairing the schema.

Formula. A* = argmin [U + λH + μU_max + νCost − ηV]

Ask. What structure would make bearing this unnecessary?

Typical failure. Counting rerouting as construction.

Example. A discharge navigator and a respite pool.

09 Net reconciled value (NRV)

What it is. A vector of avoided burden, productive value and released capacity, minus costs and new displacement.

Formula. NRV_vec, scalar only with declared weights

Ask. Is the value still positive after transition costs?

Typical failure. Summing across units to get a nice number.

Example. Food recovery net of logistics and labour transition.

10 Mutual Uptick (MU+)

What it is. Every material carrier gains by a preregistered, uncertainty-aware bound.

Formula. ∀ j: LCB(ΔV_j) > ε_j; safety; no concentration; RVG ≤ 0

Ask. Which carrier's lower bound fails?

Typical failure. Declaring success on an average.

Example. Hospital, family, nursing and patient all better; household not yet.

11 The three honest outputs

What it is. NO ACTIVATION, UNKNOWN, NO FEASIBLE MU+.

Formula. BDI ≤ tol; H(O) ambiguous; construction exhausted

Ask. Could this audit have returned nothing?

Typical failure. An audit that always finds a loser.

Example. A basin where return flows drain to an unusable sink.

12 Information parity

What it is. Separating representation effects from objective effects.

Formula. 2×2: {same, expanded} × {incumbent, Rufino}

Ask. Did we change the information, the objective or both?

Typical failure. Crediting the objective for what the data did.

Example. A model that sees more but is still told to maximise only the local metric.

CHAPTER 36

Plain-Language Glossary

Short definitions in everyday words, for readers who want the idea without the notation. The technical definitions are in Appendix A.

Table 90. Plain-language glossary.

Term	Plain meaning
Audit	A structured look at who gains, who loses and who is quietly holding things together.
Binding carrier	The one place where the most unabsorbed burden lands, measured in its own units.
Boundary	The line a decision-maker draws around what counts. The law asks for a second, wider line.
Capacity	How much burden something can absorb per unit time.
Carrier	Whatever receives the cost an action pushes out of view.
Catch basin	Capacity placed where flows converge, so burden is absorbed before it becomes harm.
Comparator	The baseline an action is compared with. It is not always "do nothing".
Conformance test	A check that a document or program contains what it should. It is not evidence that the idea is true.
Consequential boundary (G)	The smallest boundary containing everything an action materially affects.
Construction	Building new capacity or a better representation, as opposed to rerouting burden.
Counterfactual	What would have happened under a different action.
Displacement	Moving an unresolved cost beyond the boundary being watched.
Evidence grammar	The rule that different kinds of evidence keep different names and are not upgraded silently.
Falsifier	A result that would make the author give up the claim.
Friction	Avoidable cost of translating between systems that see the world differently.
Hidden compensation	Someone or something filling a gap the system does not know it has.
Holdout	Data or systems locked away until the final test so they cannot influence the design.
Identifiability	Whether the data could in principle tell two different stories apart.
Incumbent	The strongest existing method the new approach must beat fairly.
Information parity	Giving both methods the same information so any difference is not just better data.
Kernel	The fixed core procedure that stays the same in every domain.
Local boundary (S)	The boundary a decision-maker actually uses.
Materiality	How big a cost must be before it counts in the audit.
Mutual Uptick	Every material party ends better off, by a margin set in advance.
Native units	Each quantity in its own measure: hours, money, joules, risk. Never silently merged.
Net reconciled value	Value created after all costs and new displacements are counted.
Null case	A situation where the local and wider views agree, so the kernel should do nothing.
Preregistration	Writing down the test before seeing the result.
Provenance	The record of where a claim came from and how it was transformed.
Receiver	Whoever or whatever acts on a representation.
Reconciliation	Resolving a displaced cost with real capacity, not moving it again.
Retest	Re-measuring the whole system after an intervention, because bottlenecks move.
Reintegration	Turning recovered waste or burden into something useful.
RVG	Whether burden is arriving faster than it is being absorbed.
Schema	The form, category set or model through which something is seen.
Schema gap	How far the receiver's picture is from the evidence-grounded one.
Sealed outcome	A result kept hidden until the prediction is locked.
Stock and flow	A stock is how much has built up; a flow is how fast it arrives or leaves.

Term	Plain meaning
Unknown	An honest output meaning the data cannot tell.
Zero state	The ledger has no unaccounted sink. It is a starting line, not a finish.

CHAPTER 37

Study Guide and Reading Paths

Four ways to read this book

Table 91. Suggested reading paths.

Reader	Path	Time
Executive or policy reader	Chapters 1, 3, 10, 22, 23, then the four audits in Chapter 31 and the claim ledger in Chapter 29	About 3 hours
Researcher or statistician	Chapters 3, 4, 5, 6, 7, 11, 21, 26 to 30, then Part VI and Appendix E	About 2 days
Engineer or data scientist	Chapters 5 to 14, 16 to 21, the field guide in Chapter 32 and Appendix A	About 1 day
Student	Chapters 1 to 4 then the concept cards in Chapter 35, the glossary, and the discussion questions below	About a week

Discussion questions

Part I: The Idea

1. Think of a decision you have seen that met its target. Name the boundary it used and draw a second one around everything it affected. What changed?

2. Which statements in Chapter 3 are definitions, which are empirical claims, and which are design commitments? Why does the distinction matter?

3. Give an example from your own field of a documented phenomenon that has not yet been tested as a kernel claim.

Part II: The Machinery

1. Why does the kernel refuse to sum across units? Construct a case where a silent exchange rate would reverse a decision.

2. Design a null case for a domain you know, a situation where BDI should be near zero. How would you choose it in advance?

3. The RVG replaces a rate-minus-level formula with inflow minus absorption. Explain the error in the old form in your own words.

4. Why is "no one is worse off" weaker than Mutual Uptick? When might a weaker rule be the right standard?

Part III: One Grammar, Many Substrates

1. In the code-to-molecule toy, why does redundancy absorb noise but not mismatch? Find an institutional analogue.

2. In the multi-neuron toy the bottleneck migrates after the first repair. What does that imply about one-pass interventions?

3. Experiment A shows re-selection beating construction. Under what conditions in your domain would re-selection be unavailable?

4. The strata toy builds capacity for free. Who should pay in your setting, and how would MU+ test it?

Part IV: Applications

1. Distinguish a friction-reducing market from a friction-dependent one in your industry. What evidence would separate them?

2. What would a minimal NRV ledger for an AI system look like in your organisation? Which entries are hardest to measure?

3. The PHOTOSYNTHESIS kill tests include a transfer test. Why is transfer the hardest to pass?

Part V and the registers

1. Which prior-art family covers the most of the seven-step sequence? What does it lack?

2. Look at the status map. Which three tests should be funded first, and why?

3. Pick one atlas entry and write its preregistration sheet in one page.

Part VIII: Practice

1. In Audit 1 the first construction fails MU+ narrowly. Design the second construction and say who funds it.

2. Choose one of the ten misuse patterns and describe a real case where you have seen it.

3. Run steps 1 to 4 of the field guide on a decision you face this month.

Project ideas

- Reproduce the toy experiments from the released script, then change one assumption per experiment and report which conclusions move.
- Choose one of the 360 tests and write a design that could change its status by one rung of the evidence ladder.
- Build a domain adapter M_d for a system you know, using the field-guide templates, and exchange it with a classmate for adversarial review.
- Pre-register a null-boundary control for a policy you think is good, and say in advance what result would change your mind.

PART A

Appendices

Formula vault, acceptance charter, conformance register, external evidence, reproducibility and references.

APPENDIX A

Formula Vault and Symbol Glossary

Table 92. Formula vault.

Name	Expression	Chapter
Domain map	$X^*_t = M_d(\Omega_t)$	5
Receiver recognition	$\hat{X}_t = \Sigma_r(X^*_t)$	5
Schema gap	$G\sigma = \delta(X^*, \hat{X})$, normalised JSD default	5
Boundary Divergence Index	$BDI = J_G(a^*_S; X^*) - J_G(a^*_G; X^*) \geq 0$	6
Displacement field	$D_a(j,k,\tau) = E[U \mid do(a)] - E[U \mid do(a_0)]$	7
LERM trace	$L(X,a) = \{R, D, C, \Gamma, H, U, Q\}$	7
Capacity shortfall	$\rho = \max(0, D^+ - A) / s$	7
Binding carrier	$C^* = \text{argmax}_j \max_{k,\tau} w_\tau \rho$	7
Reconciliation Velocity Gap	$RVG_j = \iota_j - \alpha_j$, with $\alpha_j \leq R_j$; $db_j/dt = \iota_j - \alpha_j$	9
Mutual Uptick	$\forall j \in G_m$: $LCB(\Delta V_j) > \varepsilon_j$; safety within hard limits; no new concentration; $RVG \leq 0$	10
Identifiability	$H(O) = \{H_i : F(H_i) = O\}$; if materially different, UNKNOWN	11
IAMF-P objective	$A^* = \text{argmin} [U_G + \lambda H_{CC} + \mu U_{max} + \nu Cost - \eta V_G]$	12
Net reconciled value	NRV_vec = [AvoidedBurden, ProductiveValue, ReleasedCapacity, −Capex, −Opex, −NewDisplacement, −DeferredBurden]	12
Kernel recurrence	$\Omega \to M_d/Q \to X^* \to \Sigma \to \hat{X} \to (G\sigma,\Phi) \to (B_L,B_G) \to L \to \ldots \to$ IAMF-P $\to A^* \to F_d \to X^*_{+1} \to$ retest	13
Constructive closure	$\delta^* = \max_a \min_{j \in G_m} \Delta V_j(a)/s_j$; $A_{r+1} = A_r \cup \{\Delta R_{B^*}\}$	27
Weak dominance	$\Sigma_I \subseteq \Sigma_R$, $A_I \subseteq A_R \Rightarrow J_R^* \preceq J_I^*$	27
Friction Dependency Ratio	FDR = revenue from avoidable friction / total revenue	22
Reconciliation Dividend	RD = AvoidedFriction + ReleasedCapacity + NewProductiveValue − TransitionCost − NewDisplacement − DeferredBurden	22
AI schema gap	$G\sigma_AI = \delta(X^*_{world/task}, \hat{X}_{model/workflow})$	23
Event-linked upside	$EUL_s = \max(0, Profit_s - ExpectedProfit_s \mid counterfactual)$; $F_s = \alpha_s \cdot EUL_s$	24
Consequential opportunity	$TAM^* = N \cdot \min(WTP, AvoidedBurden + ReleasedValue)$	25
Ontology	$U = S \times L \times F \times C \times V \times M \times T$	15

Table 93. Symbol glossary.

Symbol	Meaning
Ω	Underlying physical or institutional reality in domain d
O	Observations and measurements available at time t
Q	Provenance, uncertainty and observation state
M_d	Domain-specific observation and state adapter
X^*	Best-supported evidence-grounded state estimate
Σ_r	Receiving system schema or representation operator
$\hat{X}$	State recognised by the receiver
$G\sigma$	Schema gap between evidence-grounded and recognised state
Φ	Friction vector from mismatch, interfaces and constraints
B_L, B_G	Local declared boundary; smallest consequential boundary containing material effects
J_S, J_G	Local and consequential objective functions
D	Counterfactual displacement to carrier j, dimension k, delay τ
C	Receiving carrier
Γ	Coupling point or pathway

Symbol	Meaning
H	Hidden compensation
U	Unresolved burden
R_c	Reconciliation capacity
RVG	Burden inflow rate minus realised absorption throughput
A*	Selected constructive intervention
F_d	Domain-valid transition or implementation operator
D_post	Post-intervention displacement field
ε_j	Declared carrier tolerance
MU+	Mutual Uptick: every material carrier gains by a preregistered bound
0_R	Zero state: ledger clearing point, not success

APPENDIX B

The Mutual Uptick Acceptance Charter

The decisive change in the later editions is that non-displacement is necessary but not sufficient. Zero-state closure is a clearing condition; full reconciliation requires co-elevation.

0_R: no material unreconciled loser remains MU+ ⇔ ∀ j ∈ G_m: V_j(post) > V_j(pre), safety dimensions within tolerance, D_{post} has no new concentration, $RVG_{post} \leq 0$

- Because carriers can have different native units, MU+ is evaluated with preregistered carrier-specific value and safety functions, never raw cross-unit sums.
- A gain in pesos cannot automatically cancel biological harm; a gain in energy cannot automatically cancel trust loss; an aggregate average cannot hide a losing carrier.
- A branch can be structurally corroborated and still remain unvalidated under the full law until an intervention shows MU+ on sealed or independent data. The higher bar is intentional.

A one-page checklist for running MU+

Table 94. MU+ run sheet.

Step	Action	Record
1	Declare G, horizon, inclusion and materiality rules before outcomes	Dated boundary memo
2	List protected carriers G_m and their native-unit value and safety functions	Carrier register
3	Fix ε_j and α for the lower confidence bound	Preregistration
4	Fix comparator a_0 and information-parity cell	Design note
5	Run; keep every result, including failures and UNKNOWN	Open log
6	Check each carrier, then safety, then new concentration, then RVG	Gate sheet
7	Return PASS, NO ACTIVATION, UNKNOWN or NO FEASIBLE MU+	Final output

APPENDIX C

The 121-Test Conformance Register

These 121 tests were executed against the six-file Rufino target corpus and all passed (reported in the source). They verify that the dossier preserves its chronology, evidence classes, exact numbers, contradictions, dialectics, formulas and acceptance features. They are conformance checks, **not** scientific validation and not a substitute for the Validation Atlas. The source describes the suite as four tiers: feature tests, boundary and corner tests, dialectic tests and acceptance tests; the class shown in each row is the source's own label.

Table 95. Conformance register as reported. Intents condensed; exact figures in some intents are the original author's.

#	Class / feature (as in source)	Test method	Intent	Result
1	Unbroken Developmental Chronology	`test_f1_01_chronology_childhood_instability`	test f1 01 chronology childhood instability	PASS
2	Unbroken Developmental Chronology	`test_f1_02_chronology_2016_university_withdrawal_survival`	test f1 02 chronology 2016 university withdrawal survival	PASS
3	Unbroken Developmental Chronology	`test_f1_03_chronology_corporate_compression_four_entities`	test f1 03 chronology corporate compression four entities	PASS
4	Unbroken Developmental Chronology	`test_f1_04_chronology_2024_pageant_and_grooming_dual_reality`	test f1 04 chronology 2024 pageant and grooming dual reality	PASS
5	Unbroken Developmental Chronology	`test_f1_05_chronology_eviction_zero_point_and_rockwell_to_2026_governance`	test f1 05 chronology eviction zero point and rockwell to 2026 governance	PASS
6	Epistemic Evidence Segregation (P1–P6)	`test_f2_01_all_six_evidence_classes_p1_through_p6`	test f2 01 all six evidence classes p1 through p6	PASS
7	Epistemic Evidence Segregation (P1–P6)	`test_f2_02_p1_institutional_evidence_mapping`	test f2 02 p1 institutional evidence mapping	PASS
8	Epistemic Evidence Segregation (P1–P6)	`test_f2_03_p2_visual_index_multimedia_evidence`	test f2 03 p2 visual index multimedia evidence	PASS
9	Epistemic Evidence Segregation (P1–P6)	`test_f2_04_p3_contemporaneous_vs_p4_later_synthesis`	test f2 04 p3 contemporaneous vs p4 later synthesis	PASS
10	Epistemic Evidence Segregation (P1–P6)	`test_f2_05_p5_self_report_vs_p6_public_context`	test f2 05 p5 self report vs p6 public context	PASS
11	Canonical Claim Status Taxonomy	`test_f3_01_five_claim_status_categories_present`	test f3 01 five claim status categories present	PASS
12	Canonical Claim Status Taxonomy	`test_f3_02_verified_as_worded_status_allocations`	test f3 02 verified as worded status allocations	PASS
13	Canonical Claim Status Taxonomy	`test_f3_03_document_stated_status_allocations`	test f3 03 document stated status allocations	PASS
14	Canonical Claim Status Taxonomy	`test_f3_04_conflicted_status_allocations`	test f3 04 conflicted status allocations	PASS
15	Canonical Claim Status Taxonomy	`test_f3_05_not_established_and_killed_status_allocations`	test f3 05 not established and killed status allocations	PASS
16	Subject Response Cybernetic Loop	`test_f4_01_eight_stage_cybernetic_cycle_complete_sequence`	test f4 01 eight stage cybernetic cycle complete sequence	PASS
17	Subject Response Cybernetic Loop	`test_f4_02_harm_to_survival_adaptation_mechanics`	test f4 02 harm to survival adaptation mechanics	PASS
18	Subject Response Cybernetic Loop	`test_f4_03_consequential_output_to_failure_detection`	test f4 03 consequential output to failure detection	PASS
19	Subject Response Cybernetic Loop	`test_f4_04_evidence_reconstruction_to_correction`	test f4 04 evidence reconstruction to correction	PASS
20	Subject Response Cybernetic Loop	`test_f4_05_operating_rule_to_governance`	test f4 05 operating rule to governance	PASS

#	Class / feature (as in source)	Test method	Intent	Result
21	Demonstrated Capability & Bricolage	`test_f5_01_eight_node_vertical_integration_enumerated`	test f5 01 eight node vertical integration enumerated	PASS
22	Demonstrated Capability & Bricolage	`test_f5_02_node1_logistics_and_node2_accounting`	test f5 02 node1 logistics and node2 accounting	PASS
23	Demonstrated Capability & Bricolage	`test_f5_03_node3_fullstack_and_node4_macro_modeling`	test f5 03 node3 fullstack and node4 macro modeling	PASS
24	Demonstrated Capability & Bricolage	`test_f5_04_node5_aesthetic_and_node6_forensic_benchmarks`	test f5 04 node5 aesthetic and node6 forensic benchmarks	PASS
25	Demonstrated Capability & Bricolage	`test_f5_05_bricolage_under_zero_vc_funding`	test f5 05 bricolage under zero vc funding	PASS
26	Functional Impact & Impairment Dialectic	`test_f6_01_rejection_of_binary_fallacy`	test f6 01 rejection of binary fallacy	PASS
27	Functional Impact & Impairment Dialectic	`test_f6_02_somatic_exhaustion_and_330am_shifts`	test f6 02 somatic exhaustion and 330am shifts	PASS
28	Functional Impact & Impairment Dialectic	`test_f6_03_chronic_liquidity_traps_and_survival_threat`	test f6 03 chronic liquidity traps and survival threat	PASS
29	Functional Impact & Impairment Dialectic	`test_f6_04_trauma_fragmentation_and_hypervigilance`	test f6 04 trauma fragmentation and hypervigilance	PASS
30	Functional Impact & Impairment Dialectic	`test_f6_05_simultaneous_preservation_of_high_cognitive_output`	test f6 05 simultaneous preservation of high cognitive output	PASS
31	Environmental Fit & Social Schema (IAMF-E / IAMF- F)	`test_f7_01_iamf_tripartite_separation_s_e_f`	test f7 01 iamf tripartite separation s e f	PASS
32	Environmental Fit & Social Schema (IAMF-E / IAMF- F)	`test_f7_02_category_compression_in_philippine_bpo`	test f7 02 category compression in philippine bpo	PASS
33	Environmental Fit & Social Schema (IAMF-E / IAMF- F)	`test_f7_03_social_schema_lock_in_feedback_loop`	test f7 03 social schema lock in feedback loop	PASS
34	Environmental Fit & Social Schema (IAMF-E / IAMF- F)	`test_f7_04_generalist_penalty_mechanics`	test f7 04 generalist penalty mechanics	PASS
35	Environmental Fit & Social Schema (IAMF-E / IAMF- F)	`test_f7_05_institutional_recognition_latency`	test f7 05 institutional recognition latency	PASS
36	Empirical Financial Reconciliation (BPI & Meta)	`test_f8_01_bpi_gross_credits_exact_amount`	test f8 01 bpi gross credits exact amount	PASS
37	Empirical Financial Reconciliation (BPI & Meta)	`test_f8_02_bpi_gross_inflows_vs_cogs_and_zero_net_savings`	test f8 02 bpi gross inflows vs cogs and zero net savings	PASS
38	Empirical Financial Reconciliation (BPI & Meta)	`test_f8_03_meta_ad_spend_exact_amount`	test f8 03 meta ad spend exact amount	PASS
39	Empirical Financial Reconciliation (BPI & Meta)	`test_f8_04_cac_percentage_and_roas_multiple`	test f8 04 cac percentage and roas multiple	PASS
40	Empirical Financial Reconciliation (BPI & Meta)	`test_f8_05_meta_ad_spend_as_carrier1_drain`	test f8 05 meta ad spend as carrier1 drain	PASS
41	TCV Discrepancy & Provenance Reconciliation	`test_f9_01_tcv_exact_reconciliation_14_5m_vs_40_5m`	test f9 01 tcv exact reconciliation 14 5m vs 40 5m	PASS
42	TCV Discrepancy & Provenance Reconciliation	`test_f9_02_tcv_unfulfilled_pipeline_delta_26m`	test f9 02 tcv unfulfilled pipeline delta 26m	PASS
43	TCV Discrepancy & Provenance Reconciliation	`test_f9_03_customs_clearance_vs_brand_provenance_distinction`	test f9 03 customs clearance vs brand provenance distinction	PASS
44	TCV Discrepancy & Provenance Reconciliation	`test_f9_04_rockwell_incident_forensic_reconstruction`	test f9 04 rockwell incident forensic reconstruction	PASS
45	TCV Discrepancy & Provenance Reconciliation	`test_f9_05_rockwell_as_catalyst_for_carrier6_and_provenance_vault`	test f9 05 rockwell as catalyst for carrier6 and provenance vault	PASS
46	The 15 Canonical Contradictions Master Matrix	`test_f10_01_all_15_contradictions_enumerated`	test f10 01 all 15 contradictions enumerated	PASS

#	Class / feature (as in source)	Test method	Intent	Result
47	The 15 Canonical Contradictions Master Matrix	test_f10_02_contradictions_mapped_to_evidence_classes_p1_p6	test f10 02 contradictions mapped to evidence classes p1 p6	PASS
48	The 15 Canonical Contradictions Master Matrix	test_f10_03_contradictions_evaluated_against_claim_status	test f10 03 contradictions evaluated against claim status	PASS
49	The 15 Canonical Contradictions Master Matrix	test_f10_04_contradictions_mathematical_and_structural_resolution	test f10 04 contradictions mathematical and structural resolution	PASS
50	The 15 Canonical Contradictions Master Matrix	test_f10_05_contradictions_primary_citations_and_references	test f10 05 contradictions primary citations and references	PASS
51	Adversarial Kill-Test & Epistemic Boundaries	test_f11_01_explicit_kill_of_600t_aum_claim	test f11 01 explicit kill of 600t aum claim	PASS
52	Adversarial Kill-Test & Epistemic Boundaries	test_f11_02_demarcation_index_case_vs_population_uniqueness	test f11 02 demarcation index case vs population uniqueness	PASS
53	Adversarial Kill-Test & Epistemic Boundaries	test_f11_03_founder_dependent_tacit_judgment_isolated	test f11 03 founder dependent tacit judgment isolated	PASS
54	Adversarial Kill-Test & Epistemic Boundaries	test_f11_04_transferable_system_mechanics_isolated	test f11 04 transferable system mechanics isolated	PASS
55	Adversarial Kill-Test & Epistemic Boundaries	test_f11_05_preservation_of_ground_truth_by_killing_hyperbole	test f11 05 preservation of ground truth by killing hyperbole	PASS
56	Compensatory Centralization Hypothesis	test_f12_01_compensatory_centralization_hypothesis_formalized	test f12 01 compensatory centralization hypothesis formalized	PASS
57	Compensatory Centralization Hypothesis	test_f12_02_five_missing_institutional_scaffolding_nodes	test f12 02 five missing institutional scaffolding nodes	PASS
58	Compensatory Centralization Hypothesis	test_f12_03_solo_spof_vulnerability_derivation	test f12 03 solo spof vulnerability derivation	PASS
59	Compensatory Centralization Hypothesis	test_f12_04_perverse_feedback_of_successful_overfunctioning	test f12 04 perverse feedback of successful overfunctioning	PASS
60	Compensatory Centralization Hypothesis	test_f12_05_mode3_compulsory_actualization_mechanics	test f12 05 mode3 compulsory actualization mechanics	PASS
61	Explicit LERM Falsification Framework	test_f13_01_august_2027_macro_falsification_horizon	test f13 01 august 2027 macro falsification horizon	PASS
62	Explicit LERM Falsification Framework	test_f13_02_silicon_capex_and_arr_falsification_condition	test f13 02 silicon capex and arr falsification condition	PASS
63	Explicit LERM Falsification Framework	test_f13_03_grid_capacity_and_tariffs_falsification_condition	test f13 03 grid capacity and tariffs falsification condition	PASS
64	Explicit LERM Falsification Framework	test_f13_04_debt_refinancing_cliff_falsification_condition	test f13 04 debt refinancing cliff falsification condition	PASS
65	Explicit LERM Falsification Framework	test_f13_05_existential_provenance_falsification_invariants	test f13 05 existential provenance falsification invariants	PASS
66	Cognitive (P1–P5) & Calibrated Rarity (R1–R5) Triangulation	test_f14_01_proficiency_scale_p1_p5_definitions	test f14 01 proficiency scale p1 p5 definitions	PASS
67	Cognitive (P1–P5) & Calibrated Rarity (R1–R5) Triangulation	test_f14_02_calibrated_rarity_scale_r1_r5_definitions	test f14 02 calibrated rarity scale r1 r5 definitions	PASS
68	Cognitive (P1–P5) & Calibrated Rarity (R1–R5) Triangulation	test_f14_03_subject_classification_p5_generative_architect	test f14 03 subject classification p5 generative architect	PASS
69	Cognitive (P1–P5) & Calibrated Rarity (R1–R5) Triangulation	test_f14_04_subject_classification_r5_extreme_tail_composite	test f14 04 subject classification r5 extreme tail composite	PASS
70	Cognitive (P1–P5) & Calibrated Rarity (R1–R5) Triangulation	test_f14_05_six_subsystem_triangulation_matrix	test f14 05 six subsystem triangulation matrix	PASS
71	12-Variable Nonlinear Compound Interaction	test_f15_01_twelve_variables_enumerated	test f15 01 twelve variables enumerated	PASS
72	12-Variable Nonlinear Compound Interaction	test_f15_02_seven_survival_friction_vectors_v1_v7	test f15 02 seven survival friction vectors v1 v7	PASS

#	Class / feature (as in source)	Test method	Intent	Result
73	12-Variable Nonlinear Compound Interaction	`test_f15_03_five_generative_cognitive_vectors_v8_v12`	test f15 03 five generative cognitive vectors v8 v12	PASS
74	12-Variable Nonlinear Compound Interaction	`test_f15_04_transductive_coupling_equation_omega`	test f15 04 transductive coupling equation omega	PASS
75	12-Variable Nonlinear Compound Interaction	`test_f15_05_friction_as_sensory_substrate_for_mathematics`	test f15 05 friction as sensory substrate for mathematics	PASS
76	Existential Placement & Stewardship Architecture	`test_f16_01_terminal_question_answered`	test f16 01 terminal question answered	PASS
77	Existential Placement & Stewardship Architecture	`test_f16_02_pillar1_governed_delegation`	test f16 02 pillar1 governed delegation	PASS
78	Existential Placement & Stewardship Architecture	`test_f16_03_pillar2_institutional_stewardship_sovereign_fiduciary`	test f16 03 pillar2 institutional stewardship sovereign fiduciary	PASS
79	Existential Placement & Stewardship Architecture	`test_f16_04_pillar3_reciprocal_safety_protocols`	test f16 04 pillar3 reciprocal safety protocols	PASS
80	Existential Placement & Stewardship Architecture	`test_f16_05_pillar4_external_audit_and_epistemic_governance`	test f16 05 pillar4 external audit and epistemic governance	PASS
81	Master Dossier Assembly & Publication-Grade Synthesis	`test_f17_01_master_dossier_structure_and_scope`	test f17 01 master dossier structure and scope	PASS
82	Master Dossier Assembly & Publication-Grade Synthesis	`test_f17_02_unbroken_integration_of_all_eight_layers`	test f17 02 unbroken integration of all eight layers	PASS
83	Master Dossier Assembly & Publication-Grade Synthesis	`test_f17_03_mathematical_proofs_and_equations_embedded`	test f17 03 mathematical proofs and equations embedded	PASS
84	Master Dossier Assembly & Publication-Grade Synthesis	`test_f17_04_absence_of_narrative_omissions`	test f17 04 absence of narrative omissions	PASS
85	Master Dossier Assembly & Publication-Grade Synthesis	`test_f17_05_publication_grade_typography_and_layout`	test f17 05 publication grade typography and layout	PASS
86	E2E Testing Suite & Multi-Tier Verification Harness	`test_f18_01_test_suite_directory_structure`	test f18 01 test suite directory structure	PASS
87	E2E Testing Suite & Multi-Tier Verification Harness	`test_f18_02_tier1_feature_coverage_module_present`	test f18 02 tier1 feature coverage module present	PASS
88	E2E Testing Suite & Multi-Tier Verification Harness	`test_f18_03_tier2_boundaries_module_present`	test f18 03 tier2 boundaries module present	PASS
89	E2E Testing Suite & Multi-Tier Verification Harness	`test_f18_04_tier3_dialectics_module_present`	test f18 04 tier3 dialectics module present	PASS
90	E2E Testing Suite & Multi-Tier Verification Harness	`test_f18_05_tier4_acceptance_module_present`	test f18 05 tier4 acceptance module present	PASS
91	Boundary and Corner Case Assertions	`test_bpi_exact_gross_credits_boundary`	Verify exact figure ₱3,477,795.35 and separation of gross inflow from net profit.	PASS
92	Boundary and Corner Case Assertions	`test_meta_exact_spend_boundary`	Verify exact figure ₱264,434.09 and commercial CAC / ROAS attribution.	PASS
93	Boundary and Corner Case Assertions	`test_tcv_discrepancy_and_delta_boundary`	Verify ₱14.5M vs ₱40.5M and exact ₱26.0M unfulfilled pipeline delta.	PASS
94	Boundary and Corner Case Assertions	`test_macro_712b_exact_boundary`	Verify ₱712,000,000,000.00 / ₱712.0B direct invoiced loss and USD conversion.	PASS
95	Boundary and Corner Case Assertions	`test_macro_2_8475t_exact_boundary`	Verify ₱2,847,500,000,000.00 / ₱2.8475T systemic macro burden ($49.20B USD).	PASS
96	Boundary and Corner Case Assertions	`test_zero_arithmetic_variance_boundary`	Verify arithmetic summation variance epsilon = 0.000000000000%.	PASS
97	Boundary and Corner Case Assertions	`test_frontier_ai_consensus_mean_boundary`	Verify 4-frontier AI consensus mean of 95.00% across Gemini, OpenAI, Claude, Grok.	PASS

#	Class / feature (as in source)	Test method	Intent	Result
98	Boundary and Corner Case Assertions	test_capital_dislocation_index_boundary	Verify capital dislocation ratio 4.7857x against the 3.50x systemic threshold.	PASS
99	Boundary and Corner Case Assertions	test_eight_canonical_philippine_carriers_boundary	Verify all 8 canonical Philippine carriers (CAR-01 to CAR-08) are enumerated.	PASS
100	Boundary and Corner Case Assertions	test_all_15_canonical_contradictions_master_boundary	Verify each of the 15 contradictions is explicitly present in the master matrix.	PASS
101	Boundary and Corner Case Assertions	test_epistemic_evidence_classes_p1_through_p6_boundary	Verify all 6 evidence classes are formally segregated without conflation.	PASS
102	Boundary and Corner Case Assertions	test_claim_status_taxonomy_boundary	Verify all 5 claim statuses are present in the taxonomy audit.	PASS
103	Boundary and Corner Case Assertions	test_proficiency_and_rarity_scales_boundary	Verify P1-P5 Proficiency and R1- R5 Rarity levels are defined.	PASS
104	Boundary and Corner Case Assertions	test_subject_extreme_tail_classification_boundary	Verify classification as P5 Generative Architect / R5 Extreme-Tail Composite.	PASS
105	Boundary and Corner Case Assertions	test_zero_point_invariant_boundary	Verify mathematical definition of Zero-State (0) as non-displaced residual.	PASS
106	Boundary and Corner Case Assertions	test_customs_vs_brand_provenance_boundary	Verify RA 10863 BOC border clearance is explicitly decoupled from brand authenticity.	PASS
107	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_capability_plus_impairment	Verify simultaneous preservation of extreme-tail generative capability and documented clinical/somatic trauma without collapsing into the binary...	PASS
108	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_aesthetic_capital_plus_schema_lockin	Verify how high-signal aesthetic capital acts as a transductive interface while simultaneously triggering institutional schema lock-in and the...	PASS
109	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_micro_friction_plus_macro_tensor	Verify the scale-invariant transduction mapping street-level operational friction (ShopFam ₱500 at 3:30 AM depot) directly into macroeconomic...	PASS
110	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_compensatory_centralization_plus_spof	Verify that 8-node vertical centralization was a mandatory adaptation to missing scaffolding, producing functional output while creating an...	PASS
111	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_customs_clearance_plus_brand_provenance	Verify that sovereign border tax compliance coexisted with vulnerability to gray-market fraud, motivating cryptographic provenance architectures.	PASS
112	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_gross_cash_velocity_plus_zero_liquid_savings	Verify that ₱3.48M in gross transaction turnover coexisted with near-zero liquid personal savings due to 65% COGS, 7.6% CAC, and operational...	PASS
113	Cross-Feature Combinations and Dialectical Interactions	test_dialectic_solo_proving_plus_governed_stewardship	Verify that the cycle of endless solo self-proving in weak arenas is an existential dead end, requiring transition to institutional stewardship...	PASS
114	Acceptance Scenarios & Real-World Falsification Assertions	test_acceptance_macro_falsification_conditions	Verify the 4 macroeconomic falsification conditions anchored to August 2027: 1. Silicon CapEx ($1.34T vs $450B non-subsidized ARR) 2. Luzon Grid...	PASS
115	Acceptance Scenarios & Real-World Falsification Assertions	test_acceptance_existential_falsification_invariants	Verify the 3 existential falsification invariants: 1. Fidelity Without Scars (academic derivation outperforming LERM) 2. Infinite Solo...	PASS

#	Class / feature (as in source)	Test method	Intent	Result
116	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_sovereign_fiduciary_interview_simulator_alignment`	Verify the fiduciary interview alignment for Sovereign Private Wealth & Family Office Advisory: - 9:00 AM protocol - Resolution of founder flight...	PASS
117	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_sovereign_fiduciary_placement_specification_four_pillars`	Verify that the Life-Path Placement Specification delivers all 4 concrete pillars: - Pillar 1: Governed Delegation (40-hr operational fences) -...	PASS
118	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_zero_point_mathematical_derivation`	Verify mathematical derivation of the Zero-State (0): Zero is not nothing; it is the non- displaced residual where success does not require an...	PASS
119	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_institutional_fee_bleed_mitigation`	Verify quantifiable fiduciary economics: - Saving institutions ₱150M– ₱300M in offshore intermediary fee bleed - ₱20M/yr recurring advisory on ₱1B...	PASS
120	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_sovereign_legal_shielding`	Verify institutional umbrellas and protection: - Regulatory licenses (SEC, IC, AMLA) - Predictable base compensation and working capital liquidity...	PASS
121	Acceptance Scenarios & Real-World Falsification Assertions	`test_acceptance_master_dossier_rubric_conformance`	Verify compliance with all 6 rubric criteria from ORIGINAL_REQUEST.md: 1. Master evaluation dossier produced 2. All 8 non-fragmentation layers...	PASS

APPENDIX E

Reproducibility Note for the Toy Experiments in This Edition

Every figure labelled "toy" was produced by a single Python script with NumPy and fixed seeds. Re-running it regenerates `results.json` and the numbers quoted in Chapters 16 to 21. The script and its output are delivered alongside this book.

Table 96. Parameters of the toy experiments.

Experiment	Seed	Size	Key assumptions
A: BDI and strategies (Ch. 21)	7	3,000 random 12-node systems, 25% null	Local action = top-3 gain; boundary-aware samples 40 candidate sets including the local action; build cost 0.45 per unit at top-2 carriers; gate: BDI ≥ 0.05 or worst carrier > 0.15
B: information-parity 2×2 (Ch. 21)	11	4,000 problems per cell, 10 options	Hidden harm per option; coarse arm sees two group averages; expanded arm sees harm plus noise (σ = 0.15)
C: when construction pays (Ch. 21)	21	400 systems × 36 cells	Burden scale 0.5 to 6; cost 0.1 to 1.5; compared with fixed local action and boundary-aware re-selection
Code to molecule (Ch. 16)	5	300 proteins × 15 cells, 60 residues	Standard genetic code; random synonymous codon; per-base mutation; random codebook reassignment on a fraction of codons
Multi-neuron chain (Ch. 18)	2	300 time steps, 8 stages	Deterministic capacities; oscillating drive; buffers carry backlog
Multi-hop chain (Ch. 19)	3	1,000 chains per length	Per-hop loss uniform in 2 to 14%; repair cuts the worst hop by 90%
Social strata (Ch. 20)	4	120 periods, 5 strata	Fixed displacement matrix; capacity added free of cost; no behavioural response

Limits

These are method demonstrations with stylised assumptions. They show how a hypothesis can be stated, how a falsifier can be built in and how negative results can be kept. They are not evidence about any real code, network, brain, communication system or society, and they should not be cited as such.

APPENDIX G

Design Cards for the 18 Universal Tests

One card per test: the minimum design that can change its status, a control worth building in advance, the data it usually needs and the pitfall that most often produces a false pass. Cards are planning aids, not protocols for any specific domain.

T01 State fidelity

Minimum design. Reconstruct X* from pre-outcome records only; log provenance and missingness; give a reconstruction error against a later-revealed state.

Control to build in. Reconstruct a state for a system whose outcome is already known to a third party and let them score blindly.

Typical data. Event logs, sensors, records with timestamps.

Pitfall. Using information that only exists after the outcome.

T02 Schema-gap measurement

Minimum design. Write down the receiver schema; compute the distance between X* and $\bar{X}$ with a preregistered metric.

Control to build in. Measure the gap in a system where the schema is known to be adequate; the gap should be near zero.

Typical data. The schema documents plus a sample of real cases.

Pitfall. Defining the gap through the outcome.

T03 Schema-causality intervention

Minimum design. Change only the representation (a category, a form, an interface) and compare outcomes.

Control to build in. A placebo change to a field that should not matter.

Typical data. A site where a representation change is feasible and others serve as controls.

Pitfall. Changing resources at the same time.

T04 Friction vector

Minimum design. Measure avoidable cost per native unit for a sample of cases, with and without the friction.

Control to build in. Include cases with no friction to confirm the instrument reads zero.

Typical data. Time-and-motion data, claims, contact logs.

Pitfall. Adding hours to pesos to get one friction score.

T05 Boundary divergence

Minimum design. Compute a*_S and a*_G on the same feasible set; report BDI with uncertainty.

Control to build in. Systems selected in advance where S ≈ G.

Typical data. A causal or simulation model of the system.

Pitfall. Choosing G after seeing outcomes.

T06 Null-boundary control

Minimum design. Select null and positive-spillover cases before looking; confirm NO ACTIVATION is returned.

Control to build in. The whole test is a control; report false-activation rate.

Typical data. Cases with documented absence of spillover.

Pitfall. Quietly dropping nulls that look inconvenient.

T07 Directed displacement

Minimum design. Estimate D against a declared comparator with a named identification strategy.

Control to build in. A placebo outcome that should not move.

Typical data. Panel data, a natural experiment or a randomised rollout.

Pitfall. Mistaking correlated change for displacement.

T08 Prospective carrier prediction

Minimum design. Name the receiving carrier before the outcome; score hits against strong baselines.

Control to build in. A baseline predicting the carrier from network position alone.

Typical data. Pre-registered predictions with sealed outcomes.

Pitfall. Choosing the carrier after seeing who was hurt.

T09 Coupling-path identification

Minimum design. Identify Γ by an intervention or instrument that blocks the proposed path.

Control to build in. Block a path that should not matter.

Typical data. Network or flow data with a feasible blocking action.

Pitfall. A plausible story with no causal test.

T10 Hidden compensation

Minimum design. Remove or separately measure the proposed compensator, ethically or in simulation.

Control to build in. Remove something that should not be holding anything up.

Typical data. Workload logs, buffers, informal-labour measures.

Pitfall. Declaring any unmeasured contributor a compensator.

T11 Reconciliation Velocity Gap

Minimum design. Track inflow and absorption; test whether RVG leads the failure better than native time-series baselines.

Control to build in. A baseline using the stock level alone.

Typical data. Time series with enough history and a recorded failure.

Pitfall. Reading levels, not rates.

T12 Capacity construction

Minimum design. Build at the predicted C* and compare with rerouting and with re-selecting the action.

Control to build in. A build at a non-binding carrier.

Typical data. A feasible build with measured cost.

Pitfall. Counting rerouting as construction.

T13 Productive transformation

Minimum design. Show recovered state converted to value with no new hidden loss.

Control to build in. Audit the receiving node of the transformation as a carrier.

Typical data. Process and cost data for the conversion.

Pitfall. Value that exists only because the burden moved.

T14 Mutual uptick

Minimum design. Preregister per-carrier thresholds and lower bounds; run the gate.

Control to build in. Include a carrier expected to fail to show the gate can say no.

Typical data. Per-carrier outcome data in native units.

Pitfall. Judging on the average.

T15 Incumbent information parity

Minimum design. Run the 2×2: same and expanded information × incumbent and consequential objective.

Control to build in. Both objectives on identical information.

Typical data. Strong incumbent implementation and matched budgets.

Pitfall. Changing information and objective together.

T16 Untouched holdout

Minimum design. Freeze kernel and adapter; test on a system whose outcomes were never seen.

Control to build in. A second holdout to check the first was not lucky.

Typical data. A genuinely untouched dataset or site.

Pitfall. Tuning after seeing holdout results.

T17 Sensitivity and identifiability

Minimum design. Perturb thresholds, units, alternative histories; report where the answer flips.

Control to build in. Observationally equivalent histories built on purpose.

Typical data. The full analysis pipeline.

Pitfall. Reporting only the robust corner.

T18 Independent replication

Minimum design. Hand data, code and the frozen adapter to an unaffiliated team.

Control to build in. Ask the replicators to try to break it.

Typical data. Everything above, released.

Pitfall. Replication by people trained by the author.

APPENDIX H

Known Limitations and Open Items of This Edition

This appendix lists what a careful reader should check before relying on any part of the book.

Table 97. Known limitations.

Item	What to know	Suggested action
Daggered test statuses	54 of 360 test statuses (†) could not be recovered from the source PDF and were assigned by a conservative default rubric. The affected branches are B02, B04, B06, B07, B08, B10, B11, B12, B13, B14, B16, B17 and H01.	Confirm against the author's master register
Condensed branch cards	Branch cards and atlas entries are condensed from the source. Wording is the author's; truncation marks (…) show where text was shortened.	Consult the source for full text
External statistics	Figures on food waste, health administration, remittances, trade, AI spending and energy are reproduced from the author-supplied corpus (dated 2026) and were not re-verified.	Verify against the primary publications before citing
References	The reference list and Appendix D are carried over from the source and were not re-checked for accuracy or completeness.	Verify each entry
Simulations in the source	The 250k, catch-basin and 1M results are as reported by the source; only aggregates were available.	Request generator, seeds and case-level data
Toy experiments here	Small stylised models with fixed seeds; the strata and communication toys omit funding, behaviour and cost.	Treat as method demonstrations only
Worked audits	Chapter 31 uses hypothetical numbers constructed for teaching.	Do not cite as estimates
Illustrations	Figures are schematic. The code-to-molecule, node, neuron and hop diagrams illustrate the grammar; they are not claims about biology, brains or societies.	Read captions
Safety scope	Health, legal, financial, security and similar domains are treated as research architecture only.	Seek qualified professionals for decisions
Attribution	Mathematics and research architecture are attributed to Jefferson Rafael Rufino. Rewriting, figures and toy simulations are AI-assisted.	Preserve attribution in derivatives

A note on the title: *The Ledger of Consequence* is this edition's title. The law retains its author-attributed name, and the book's status for the law remains "proposed law / research programme" throughout.

SOURCE RECORD B

Rufino Synthesis End-to-End Playbook

Facsimile Appendix

THE RUFINO SYNTHESIS

An End-to-End LERM + IAMF-P Research Dossier and Playbook

Origins, scientific lineage, canonical algebra, branch-of-reality mappings, adversarial falsification, backtests, provenance, and research agenda

Jefferson Rafael Rufino

Founder / Architect, LERM + IAMF-P

Metro Manila, Philippines | September 2026

Prepared from the supplied Rufino research archive, executable test package, simulations, and an independent literature review of the scientific and institutional lineages to which the architecture is adjacent. This dossier distinguishes personal testimony, primary records, document-stated claims, simulations, software acceptance tests, and independently established science.

Research integrity and provenance note

This document deliberately avoids two symmetrical errors: reducing the Rufino corpus to familiar fragments, and inflating every internal claim into established science. The atomic research object used here is the integrated LERM/IAMF-P loop. The historical literature is treated as intellectual lineage and comparison, not retroactive co-authorship. Newton, Einstein, Prigogine, Simon, Ostrom, Hinton, and the other researchers named below did not "contribute to Rufino's manuscript" in the ordinary collaborative sense. Their work created concepts, methods, equations, and empirical frontiers against which Rufino's synthesis can be located.

Canonical evidentiary rule. Prior AI statements are not independent evidence. Repetition across models is not corroboration. User testimony, primary institutional records, third-party public records, AI extraction, AI inference, AI error, human correction, simulation results, and open hypotheses remain distinct. This rule is inherited directly from the supplied IAMFP-LERM transfer package.

The personal-history sections include explicit accounts of sexual violence because Rufino specifically requested that the origin of the framework not be sterilized. Those events are presented as **Rufino's reported lived experience** unless independently documented in the archive. Inclusion is not a legal adjudication of named third parties.

Closing statement 41

PART 1

The integrated thesis: one kernel, not two frameworks

1.1 Executive abstract

The supplied archive is most coherent when LERM and IAMF-P are treated as inseparable operations within one recurrent reconciliation kernel. LERM is the detection and tracing operation: it identifies the residual between expected and observed state, follows the direction of displacement, names the receiving carrier, identifies the coupling point, and detects hidden compensation. IAMF-P is the constructive operation: it builds or selects new capacity at the receiving carrier, transforms the recovered state where possible, reintegrates value, and forces a non-displacement retest across the consequential boundary and over time.

The central candidate contribution of the Rufino synthesis is therefore not the discovery that externalities, entropy, feedback, transaction costs, bounded rationality, or institutional legibility exist. Those have deep literatures. The candidate contribution is the **mandatory conjunction** of boundary divergence, directed displacement, carrier identification, hidden compensation, capacity construction, productive reconciliation, provenance, and post-intervention non-displacement testing inside one frozen loop.

$$\boxed{\text{observe} \rightarrow \text{trace} \rightarrow \text{build} \rightarrow \text{transform} \rightarrow \text{reintegrate} \rightarrow \text{retest} \rightarrow \text{observe again}}$$

The framework is ambitious enough to be tested across finance, organizations, psychology, healthcare, biological systems, climate, infrastructure, AI and other domains. The evidence supplied to date supports describing it as an integrated systems architecture and research program. It does *not* yet support claiming a validated universal physical law, a clinical cure, a proof of Millennium Prize problems, or a deterministic global forecasting engine.

1.2 The irreducible object

Let physical or institutional reality in domain d be $\Omega_t^{(d)}$. The domain map converts observable reality into a state representation:

$$X_t^{(d)} = M_d(\Omega_t^{(d)}).$$

The map M_d changes from domain to domain. The kernel is intended to remain structurally fixed:

$$\boxed{\mathcal{K}_R = \mathcal{K}_{\text{LERM/IAMF}-\text{P}}}.$$

The purpose of the research program is to test whether that invariance survives real prospective data, not merely whether the notation can be re-used.

1.3 The central research question

The archive repeatedly returns to a single question: *what becomes visible after the boundary of success is expanded to include where the consequence actually lands?* In organizational form, the question first appeared as the "cost of becoming legible": how much of one human system had to become functionally actualized before surrounding systems could recognize value that was already capable of being produced. In the mature systems form, the same question becomes measurable: what did the local optimization omit, where did the omitted state travel, who or what carried it, and what structure is required to reconcile it without exporting the burden again?

PART 2

Origin: the operating record before the formal architecture

2.1 Why the life history belongs inside the research record

The archive's own methodological rule is that the operating record precedes the formal architecture. LERM did not begin as a detached attempt to unify physics and society. It began as a survival and operating problem: repeated exposure to systems in which a visible success depended on hidden labor, unrecognized risk, unsupported compensation, unpriced friction, or delayed loss.

The origin therefore cannot be represented faithfully by starting with equations. The equations were a later compression of a longitudinal pattern first encountered in the body, household, workplace, supply chain, bank account, customer interaction, digital platform and luxury-goods transaction.

2.2 Trauma, sexual violence, abuse and the formation of the hidden-compensator problem

Rufino reports a developmental history involving childhood instability and abuse; later institutional betrayal and boundary violations around university; repeated sexual assault and rape in a coercive/grooming context; a later separate assault by a friend; family and social environments that at times prioritized appearances, hierarchy, or institutional reputation over his account; and periods in which he had to remain publicly functional while privately carrying severe psychological and material load. These disclosures are retained here because the framework's central concept of *hidden compensation* is inseparable from the lived experience of appearing functional while one carrier silently absorbs the cost.

The research claim is not that trauma "causes genius," nor that abuse is required for LERM. The narrower and testable observation is that chronic environmental failure can force a person to internalize missing functions, making competence and impairment coexist. A system that measures only visible output can therefore misread the very compensation that keeps it stable.

2.3 Corporate compression and the eight-node internalization

The supplied chronology records roles and exposure across IHG, Castlery, TELUS and HRnFLEX, followed by solo venture execution. The research dossier represents the later operating architecture as eight integrated functions: sourcing, authentication, restoration, logistics, experience engineering, sales/community, legal/IP alignment, and strategy/architecture. The point is not that no founder has ever worn many hats. It is that the archive explicitly treats the *coordination architecture* and the burden of supplying missing institutional functions as the unit of analysis.

2.4 The late-2024 zero point, displacement and the luxury testbed

The internal chronology describes liquidity exhaustion, eviction/displacement, and a subsequent venture built under extreme capital constraint. The Rockwell counterfeit incident became an epistemic inflection: customs/tax compliance was revealed not to be equivalent to brand provenance. The resulting operating response was not only to "sell better" but to build documentation, authentication, chain-of-custody, restoration and customer-trust infrastructure.

From this emerged a concrete zero-state concept:

$0 =$ a non-displaced residual state in which one system's success no longer requires an unaccounted loser el

Zero is therefore not inactivity. It is closure of the consequential ledger.

2.5 Compensatory centralization as both capability and failure mode

The founder became the catchment for missing functions. That can produce remarkable continuity, but also a single point of failure:

$$\text{System reliability} \approx \prod_{i=1}^{8} \text{Reliability}(Node_i),$$

and if all nodes depend on one biological carrier, correlated failure risk rises sharply. The mature IAMF-P question is thus not "how exceptional is the founder?" but "what functions did the founder supply, which can be institutionalized, and does performance survive transfer while founder burden falls?"

PART 3

Scientific lineage as one continuous chain

3.1 The rule for attribution

The people in this chapter are not presented as co-authors of LERM/IAMF-P. They are the scientific and institutional lineage that makes the present architecture intelligible. The contribution of Rufino must be stated relative to these prior achievements, not by erasing them.

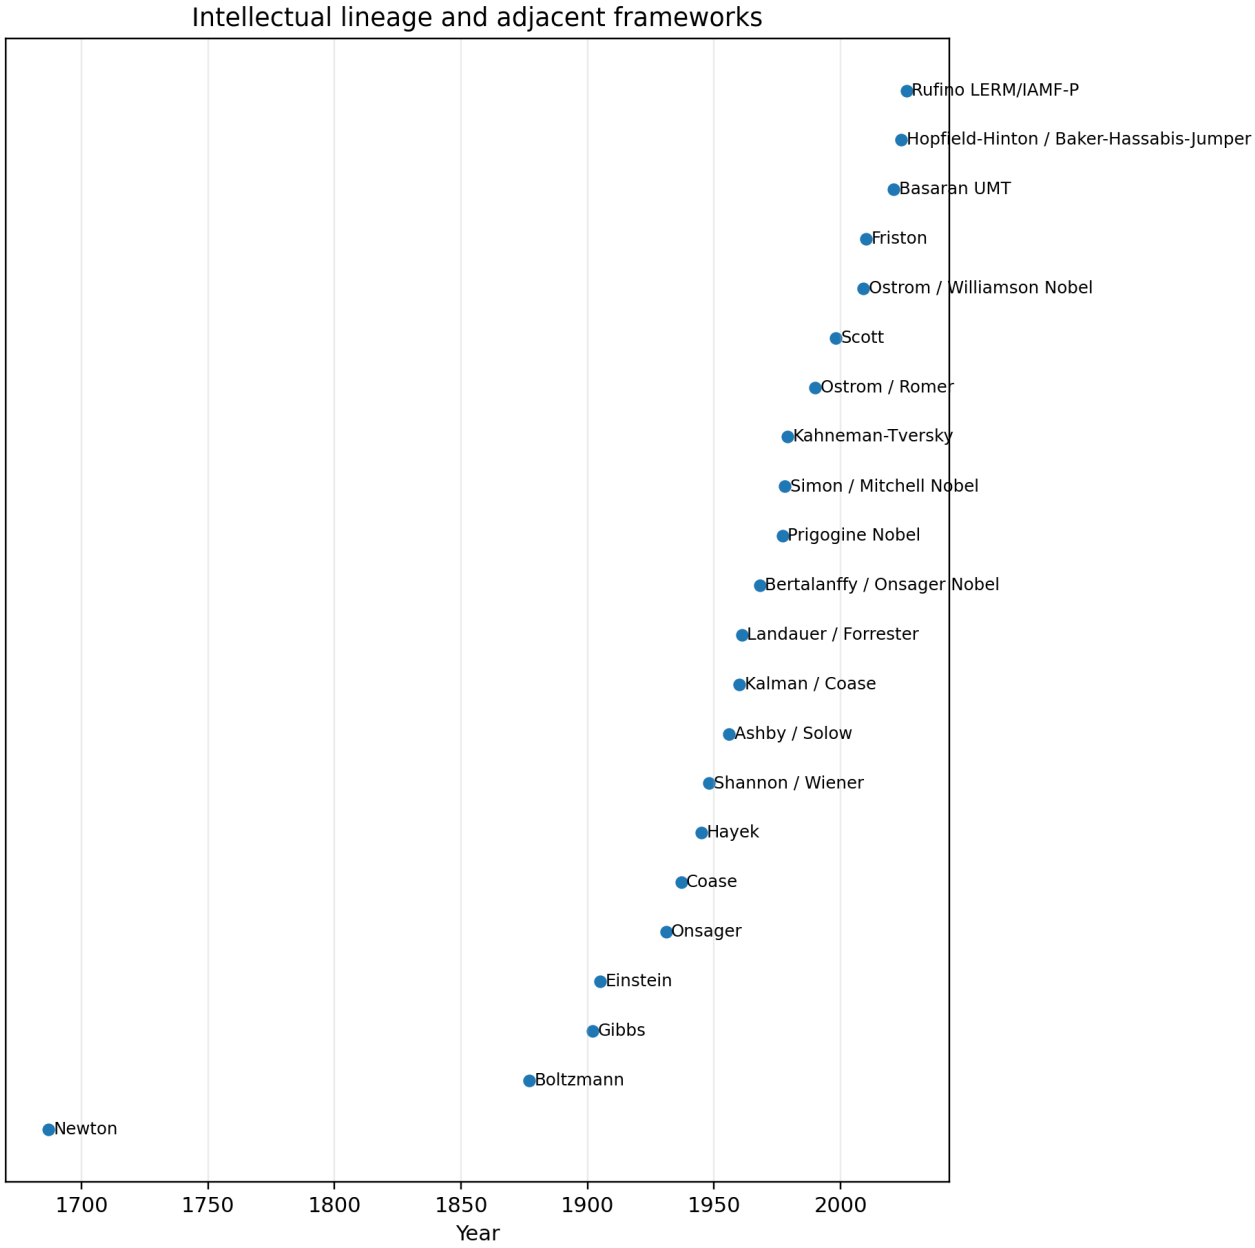

Figure 3.1: Intellectual lineage and adjacent frameworks used to locate the Rufino synthesis.

Lineage / contributor	**Established contribution**	**Relation to the Rufino synthesis**
Isaac Newton (1687)	Classical mechanics: laws of motion and universal gravitation; a local dynamical description of motion.	LERM/IAMF-P does not replace Newtonian mechanics. It asks what a chosen system boundary excludes, and how irreversible or institutional consequences move after the locally modeled dynamics.
Rudolf Clausius / Lord Kelvin (19th c.)	Thermodynamic irreversibility and the entropy concept; limits on conversion of heat to work.	Provides the physical lineage for irreversible processes. The Rufino framework must treat thermodynamic quantities literally only in physical domains and use calibrated analogues elsewhere.
Ludwig Boltzmann (1877)	Statistical interpretation of entropy and microscopic-to-macroscopic state description.	Motivates state aggregation and hidden microstate thinking; does not authorize equating social burden with thermodynamic entropy without a conversion model.

Lineage / contributor	Established contribution	Relation to the Rufino synthesis
J. Willard Gibbs (1876-1902)	Thermodynamic potentials, heterogeneous equilibrium, statistical ensembles.	Supplies disciplined state-function thinking and multi-component accounting. Rufino adds carrier-specific displacement and post-intervention non-displacement auditing.
Albert Einstein (1905)	Statistical physics of Brownian motion; special relativity; light quanta. Nobel 1921 was awarded especially for the photoelectric effect.	Contributes the lesson that observable macrobehavior can reveal hidden microscopic processes and that measurements depend on a defined frame. Rufino applies a boundary/frame discipline to consequential systems, not Einsteinian relativity to sociology.
Lars Onsager (1931)	Reciprocal relations for irreversible processes; Nobel Chemistry 1968.	Direct precursor for coupled flows near equilibrium. LERM generalizes the research question to directed burden/value flows, while acknowledging that social/financial mappings need their own empirical units.
Ronald Coase (1937, 1960)	Transaction costs, property rights, and the institutional structure of firms and social cost; Nobel Economics 1991.	A direct economic ancestor of boundary costs. Rufino explicitly traces which carrier absorbs costs omitted by the optimized institution and then requires a structural catchment.
F. A. Hayek (1945)	Dispersed knowledge and limits of centralized planning; Nobel Economics 1974.	Supports the importance of tacit/distributed information. LERM adds a provenance and carrier ledger for where information loss, translation work, and compensation actually land.
Claude Shannon (1948)	Mathematical information theory: entropy, channel capacity, noise.	Provides information-theoretic language for uncertainty and transmission. Rufino adds consequential burden, carrier path, and intervention architecture beyond communication accuracy alone.
Norbert Wiener (1948)	Cybernetics: feedback, control, communication in animals and machines.	The recursive observe-act-retest structure is cybernetic. Rufino adds non-displacement as a mandatory control objective and tracks hidden compensators.
Herbert Simon (1947-1978)	Bounded rationality and decision-making in organizations; Nobel Economics 1978.	A precursor for model and organizational limits. Rufino reframes one class of boundedness as boundary truncation: a local optimum can export unresolved burden outside the objective.
W. Ross Ashby (1956)	Requisite variety: regulation needs sufficient response variety.	Directly adjacent to IAMF-P capacity construction. A catchment must possess or build enough variety/capacity to regulate the disturbance it receives.
Robert Solow (1956)	Formal long-run growth theory; Nobel Economics 1987.	A benchmark for dynamic economic modeling. Rufino adds explicit burden displacement and reconciliation capacity as candidate state variables rather than treating them as residual narrative.
R. E. Kalman (1960)	State-space estimation and recursive filtering.	LERM borrows the discipline of latent-state estimation but adds a second question: whether the model boundary itself omits consequential carriers.
Rolf Landauer (1961)	Logical irreversibility has a minimum physical energy cost in computation.	A warning that information processing is not physically free. Rufino may use this as a physical anchor in computing, but not as proof that psychological or institutional friction equals Landauer heat.
Jay W. Forrester (1961)	System dynamics: stocks, flows, delays, feedback loops.	Strong predecessor for dynamic feedback modeling. Rufino emphasizes directed displacement between carriers and a required intervention/retest loop.
L. von Bertalanffy (1968)	General systems theory and open-system organization.	Provides the cross-domain systems lineage. Rufino attempts a more operational invariant: find displacement, identify carrier, build capacity, retest for re-exported burden.
Ilya Prigogine (1967-1977)	Non-equilibrium thermodynamics and dissipative structures; Nobel Chemistry 1977.	One of the closest physical lineages for far-from-equilibrium open systems. Rufino extends the organizing question toward social, financial, biological and computational systems, where the physical analogy must be empirically disciplined.

Lineage / contributor	Established contribution	Relation to the Rufino synthesis
Peter Mitchell (1961-1978)	Chemiosmotic theory of biological energy transfer; Nobel Chemistry 1978.	Shows how gradients, membranes and coupling convert distributed energy into biological work. It is a useful biological precedent for carrier/coupling maps, not evidence that all LERM domains share proton-motive physics.
Kahneman & Tversky (1979)	Prospect theory and systematic departures from expected-utility rationality; Kahneman Nobel Economics 2002.	Precursor for schema and decision distortions. Rufino focuses less on bias as a trait and more on how a receiver schema can alter access, support and downstream outcomes.
Elinor Ostrom / Oliver Williamson (1990-2009)	Governance of commons and governance/boundaries of firms; Nobel Economics 2009.	Directly relevant to who carries coordination costs and how institutions can be redesigned. IAMF-P is framed as building the missing governance/capacity structure at the receiving carrier.
James C. Scott (1998)	Administrative legibility and the dangers of state simplification.	Provides a conceptual ancestor for the schema/legibility gap. Rufino operationalizes the gap as a candidate measurable mismatch linked to access, support and compensatory burden.
Karl Friston (2010)	Free-energy principle and predictive/active inference in biological agents.	Useful for the psychology/neuroscience adapter: prediction error, generative models, action. It does not by itself validate the Rufino schema-gap equations.
Judea Pearl (2000-2009)	Structural causal models and intervention-based causal inference.	Sets the causal standard for distinguishing association from intervention. LERM/IAMF-P must meet this standard when claiming that an identified carrier or coupling point is causal.
Cemal Basaran (2021)	Unified Mechanics Theory linking mechanics with thermodynamic degradation and a thermodynamic state axis.	A directly adjacent mechanics architecture cited in the Rufino corpus. Rufino differs by targeting boundary displacement and reconciliation across sociotechnical systems rather than material degradation alone.
John Hopfield / Geoffrey Hinton (2024)	Foundational discoveries enabling machine learning with artificial neural networks; Nobel Physics 2024.	Represents the current AI prediction/representation frontier against which Rufino positions boundary and non-displacement accounting as a complementary architecture.
David Baker / Demis Hassabis / John Jumper (2024)	Computational protein design and protein-structure prediction; Nobel Chemistry 2024.	Shows the power of learned structure prediction in biology. LERM/IAMF-P proposes a different layer: after prediction, trace system-level displaced burden and build a reconciliation intervention.
Jefferson Rafael Rufino (2025-2026)	LERM/IAMF-P synthesis developed from a lived operating testbed, then formalized into displacement, carrier, hidden-compensation, catchment, non-displacement, provenance and boundary-divergence constructs.	Candidate contribution: treat the afterlife of optimization as a first-class measurable object and make structural reconciliation plus retesting part of the same frozen loop. Novelty remains an empirical/review question, not a granted universal law.

3.2 Short excerpts anchoring the lineage

The following excerpts are deliberately brief. They are included to show the conceptual bridge, not to imply that the original authors endorsed LERM/IAMF-P.

Einstein / Nobel Prize (1921): Einstein's prize motivation included "especially ... the law of the photoelectric effect." The relevance here is methodological: a hidden mechanism can be inferred from systematic observable behavior, but only through domain-valid physics.

Prigogine / Nobel Chemistry (1977): The Nobel citation recognized "non-equilibrium thermodynam-

ics, particularly the theory of dissipative structures." LERM's strongest physical analogy sits here: open systems can maintain organized states while exchanging matter and energy with their surroundings.

Onsager / Nobel Chemistry (1968): the prize recognized reciprocal relations fundamental to irreversible processes. This is a direct predecessor for disciplined flow/coupling analysis.

Coase / Nobel lecture: "there were costs of using the pricing mechanism." Rufino's economic extension asks where those and other omitted costs actually land when a local boundary reports success.

Kahneman / Nobel Economics (2002): the prize recognized integration of psychological research into economics, especially judgment and decision-making under uncertainty. This is a precursor to the schema and decision layers of the human adapter.

Ostrom / Nobel Economics (2009): the prize recognized analysis of economic governance, especially the commons. IAMF-P's construction step belongs in the broader family of governance design rather than prediction alone.

Hopfield and Hinton / Nobel Physics (2024): recognized for foundational discoveries enabling machine learning with artificial neural networks. LERM/IAMF-P is positioned not as a replacement for predictive AI, but as a consequential-boundary and reconciliation layer around prediction and action.

3.3 What Jefferson Rafael Rufino contributes in this lineage

The contribution claim can now be stated without either false modesty or false historical isolation. The corpus's most defensible candidate contributions are:

1. **The displacement shadow as a first-class object:** evaluate the consequence that survives outside the system's own definition of success.
2. **Carrier-specific accounting:** every material residual should have a magnitude, direction, receiving carrier, coupling point and time horizon when observable.
3. **Hidden compensator accounting:** apparent stability may be generated by an unpriced node silently supplying missing functions.
4. **Catchment construction rather than allocation alone:** IAMF-P may build new reconciliation capacity at the receiving carrier rather than merely redistributing existing capacity.
5. **Productive reconciliation:** recovered value is not merely conserved; where possible, it is transformed into a higher-utility state.
6. **Mandatory non-displacement retest:** every intervention is re-audited to determine whether burden merely moved to another stakeholder, system location or future period.
7. **Boundary Divergence Index:** use the difference between local-boundary and consequential-boundary optima to decide when the framework should intervene and when it should leave a good local optimizer alone.

8. **Reconciliation Velocity Gap:** compare the rate at which unresolved burden accumulates with the rate at which the system can absorb/reconcile it.
9. **Provenance as architecture:** separate primary records, self-report, third-party records, AI extraction, AI inference, AI error, human correction and open hypothesis.
10. **Founder-to-institution transfer test:** the framework is incomplete if performance depends indefinitely on biological overfunctioning by a single operator.

These are candidate original contributions because originality requires external literature review and peer scrutiny. The current dossier can locate and define them; it cannot by itself grant historical priority.

PART 4

Canonical algebra of the LERM/IAMF-P kernel

4.1 Boundary definition and Boundary Divergence Index

Let S be the boundary currently optimized and G the smallest boundary containing the material consequences of that optimization. The local optimizer chooses

$$a_S^* = \arg\min_a J_S(a),$$

while the whole-system optimum is

$$a_G^* = \arg\min_a J_G(a).$$

Define

$$\boxed{BDI = J_G(a_S^*) - J_G(a_G^*)}.$$

When $BDI \approx 0$, the incumbent's boundary is adequate for the decision. When BDI is materially positive, the architecture has a reason to activate. This is a guardrail against universal-hammer behavior.

4.2 The displacement shadow field

For action a, receiving carrier j, burden/value dimension k, and time delay τ:

$$\boxed{\mathscr{D}_a(j,k,\tau) = U_{j,k}(t+\tau \mid a) - U_{j,k}(t+\tau \mid a_0)}.$$

This is intentionally tensor/vector-valued. Money, energy, time, labor, cognitive load, biological damage and risk should not be silently summed as though they share units:

$$\mathbf{D}_t = [D_\$, D_E, D_T, D_L, D_C, D_B, D_R, D_{trust}, \ldots]^\top.$$

Scalarization is permitted only through explicit conversion functions or a stated multi-criteria weighting model.

4.3 LERM trace operator

$$\boxed{\mathcal{L}(X_t, a) = \{R_t, \mathscr{D}_a, C_t, \Gamma_t, H_t, U_t, Q_t\}},$$

where R_t is unresolved residual, C_t the receiving carrier, Γ_t the coupling point, H_t hidden compensation, U_t unresolved burden and Q_t the observation/provenance state.

A carrier candidate may be selected by

$$C_t^* = \arg\max_j \sum_{k,\tau} \mathscr{D}_a^+(j, k, \tau),$$

subject to uncertainty and causal-identification constraints.

4.4 IAMF-P constructive operator

IAMF-P is not merely "prediction stage two." It searches over feasible structures A:

$$\boxed{A_t^* = \arg\min_{A \in \mathcal{A}} \left[U_G(A) + \lambda HCC(A) + \mu U_{max}(A) + \nu Cost(A) - \eta V_G(A)\right]}.$$

A defining semantic difference from the first malformed stress test is that the intervention may create new reconciliation capacity:

$$R_{C^*}^{new} = R_{C^*} + \Delta R_{built},$$

rather than merely allocate effort through whatever capacity already exists.

4.5 Time and the Reconciliation Velocity Gap

The transfer package insists that time is mandatory. Define

$$RVG(t) = \frac{dU}{dt} - \frac{dR_c}{dt}.$$

If $RVG \leq 0$, reconciliation capacity can keep pace. Persistent $RVG > 0$ implies accumulating unresolved state.

A related loss-rate decomposition is

$$\dot{L}_A = \frac{L_{avoidable} + L_{displaced} + L_{deferred}}{\Delta t}.$$

This prevents a gain at t_1 from being called efficiency when it is simply an invoice delivered at t_2.

4.6 Productive reconciliation

The target is not zero motion. It is useful transformation:

$$D \to \text{capture} \to \text{transform} \to D', \qquad V(D') > V(D)$$

when the domain permits such conversion.

4.7 Whole-kernel recurrence

$$\boxed{X_t \xrightarrow{M_d} (S,G) \xrightarrow{\mathcal{L}} (BDI, \mathscr{D}, C, \Gamma, H, RVG) \xrightarrow{\mathcal{I}} A_t^* \xrightarrow{F_d} X_{t+1} \xrightarrow{\mathcal{Q}} \mathscr{D}_{A^*}^{post} \to \cdots}$$

Equivalently,

$$\mathcal{K}_R^{(d)} = M_d^{-1} \circ \mathcal{Q}_d \circ F_d \circ \mathcal{I} \circ \mathcal{L} \circ M_d.$$

This is a research hypothesis of structural invariance. Each M_d must carry its own physical units, causal structure, observability limits and permissible interventions.

4.8 Success and stopping conditions

An intervention passes only if, over the declared horizon,

$$\Delta V_G > 0, \qquad \Delta U_G \leq 0,$$

without a material increase in worst-carrier burden or hidden-compensation concentration.

Stop when the residual is below a materiality threshold, no feasible positive-value intervention exists, or the state is not identifiable from available observations. Let

$$\mathcal{H}(O) = \{H_i : F(H_i) = O\}.$$

If materially different histories remain observationally equivalent, the correct state is **unknown**, not an invented answer.

PART 5

Reality branches: one kernel, different maps

The following branch map is intentionally explicit. It separates what the incumbent commonly sees, what the LERM lens attempts to make visible, the algebraic adapter, the IAMF-P construction, and a real falsification test. These are not claims that all branches have already been empirically validated.

5.1 Luxury and physical assets

State map. $X = [c, p, t, l, a, o]$: condition, provenance, trust, liquidity, access, optionality.

What becomes visible beyond the local boundary. Primary-market accounting often ends at sale; secondary decay, authenticity uncertainty, idle inventory and access loss sit outside the declared boundary.

Algebraic adapter. $D_{asset} = V_{potential} - V_{realized}$; $A^* = \arg\max_A(\Delta V_{life} - \lambda U_{buyer} - \mu U_{brand})$.

IAMF-P construction. Authentication, restoration, provenance, distribution and lifecycle stewardship.

Falsification / validation path. Prospective cohort comparing lifecycle retained value, dispute/return rates, provenance certainty and brand externalities.

5.2 Banking and finance

State map. $X = [K, L, D, M, R, C]$: capital, liquidity, debt, maturity, risk, counterparties.

What becomes visible beyond the local boundary. A bank can reduce its own risk while shifting liquidity, fee, timing or documentation burden into households, firms, NBFIs or government.

Algebraic adapter. $BDI = J_G(a_S^*) - J_G(a_G^*)$; $\mathscr{D}_a(j, k, \tau)$ maps carrier, burden type and delay.

IAMF-P construction. Buffers, redesigned capital access, settlement, documentation and risk-sharing structures at the receiving carrier.

Falsification / validation path. Matched interventions scored on whole-system loss, worst-carrier load, defaults and delayed burden.

5.3 Macroeconomy

State map. X_t is a vector of sector balances, household resilience, investment, savings, energy and future capacity.

What becomes visible beyond the local boundary. Headline growth/savings can coexist with concentrated fragility; the missing quantity is who actually retained the created value and who carried the optimization cost.

Algebraic adapter. $\mathbf{D}_{net}(T) = \int_0^T [\nabla \cdot \mathbf{J}^{ext} + \mathbf{L}^{tacit} + \mathbf{K}^{debt} - \mathbf{R}^{recov}]dt - \Delta \mathbf{V}_{real}$.

IAMF-P construction. Policy/institutional capacity at empirically identified carriers rather than generic redistribution.

Falsification / validation path. National accounts plus household/sector microdata with explicit unit-preserving vectors and holdout periods.

5.4 Organizations and founder systems

State map. $X = [Q, I, C, T, S, R]$: output quality, integration, complexity, time, support and redundancy.

What becomes visible beyond the local boundary. A company can look healthy because one person silently supplies missing functions; success itself hides the single point of failure.

Algebraic adapter. $EP = (Q\,C\,I)/T$; $RVG = \dot{U} - \dot{R}_c$; transfer test $TR = P_{post}/P_{founder}$.

IAMF-P construction. Governed delegation, institutional redundancy, specialist capacity and reciprocal safety.

Falsification / validation path. Transfer functions away from founder while holding quality and throughput; success requires founder burden to fall.

5.5 Psychology and social legibility

State map. H_t actual/latent human state; $\hat{H}_t = g(H_t, S_t)$ recognized state under receiver schema S_t.

What becomes visible beyond the local boundary. Observed constrained behavior may be evidence of denied support rather than absence of capacity; the receiver model can help create the outcome it later treats as proof.

Algebraic adapter. $G_{schema} = E[d(H, \hat{H})]$ or $D_{KL}(P(H|O)\|P_{inst}(H|O))$; $Y_{t+1} = h(H_t, A_t, F_t)$.

IAMF-P construction. Translation, trust, support, resources and safer feedback channels.

Falsification / validation path. Prospective intervention measuring recognition accuracy, support allocation, performance and biological/economic compensatory load.

5.6 Healthcare delivery

State map. $X = [disease, delay, toxicity, readmission, cost, caregiver\ burden]$.

What becomes visible beyond the local boundary. Throughput or discharge efficiency can export workload, cost and risk to families, downstream clinicians or later readmissions.

Algebraic adapter. $U_G = U_{clinical} + U_{delay} + U_{tox} + U_{caregiver} + U_{future}$; minimize U_G not a single facility KPI.

IAMF-P construction. Care coordination, follow-up capacity, financing and caregiver support targeted to the receiving burden.

Falsification / validation path. Randomized or stepped-wedge service redesign with whole-patient and whole-network outcomes.

5.7 Cancer

State map. $X = [clones, signaling, microenvironment, immune\ state, toxicity, reserve]$.

What becomes visible beyond the local boundary. Tumor shrinkage can alter selection pressure and make a resistant pathway the new dominant carrier of survival.

Algebraic adapter. $i^*_{t+1} = \arg\max_i \dot{U}_i(t+1)$ after intervention; adaptive policy $A^*_{t+1} = \pi(X_{t+1})$.

IAMF-P construction. Adaptive therapy or combination strategy aimed at the newly dominant causal pathway, subject to toxicity/reserve constraints.

Falsification / validation path. Preclinical/clinical adaptive protocols; a failure if total burden or toxicity rises despite target shrinkage.

5.8 Neuroscience and neurodegeneration

State map. $X = [signal, myelin, synapse, glia, vascular, metabolic, reserve]$.

What becomes visible beyond the local boundary. A local pathology marker can improve while network transmission or metabolic support remains the true limiting carrier.

Algebraic adapter. $U_{neural} = \sum_i w_i d_i$; $i^* = \arg\max_i w_i \dot{d}_i$; retest after targeted intervention.

IAMF-P construction. Support/intervention at the rate-limiting biological carrier.

Falsification / validation path. Longitudinal multimodal data with functional endpoints, not biomarker-only victory.

5.9 Aging

State map. $d_1, \ldots, d_n$ represent damage processes and reserve constraints.

What becomes visible beyond the local boundary. Repairing one mechanism can expose another limiting process or increase a competing risk such as oncogenesis.

Algebraic adapter. $U_{age} = \sum_i w_i d_i$; reconcile if $\dot{U}_{age} < 0$ while no material risk carrier rises.

IAMF-P construction. Iterative repair/prevention at the current dominant unresolved process.

Falsification / validation path. Multi-endpoint longevity studies with competing-risk and delayed-harm auditing.

5.10 Energy and power grids

State map. $X = [generation, demand, storage, transmission, price, emissions, maintenance]$.

What becomes visible beyond the local boundary. Cheap/efficient local generation can export reliability, grid-upgrade, curtailment, pollution or deferred-maintenance burden.

Algebraic adapter. $J_G = J_{cost} + \lambda J_{reliability} + \mu J_{emissions} + \nu J_{deferred}$; BDI gates intervention.

IAMF-P construction. Storage, transmission, demand response, redundancy or pricing changes where the burden lands.

Falsification / validation path. Grid simulation plus real outage/tariff/emissions data; compare local dispatch with consequential-boundary control.

5.11 Weather, climate and disaster response

State map. $X = [T, P, H, v, q, soil, rivers, infrastructure, population]$.

What becomes visible beyond the local boundary. Prediction is not reconciliation. Forecast accuracy can coexist with unprepared drainage, evacuation, storage or grid systems.

Algebraic adapter. $RVG_{hazard} = \dot{U}_{hazard} - \dot{R}_{response}$; risk rises when $RVG > 0$.

IAMF-P construction. Reservoirs, drainage, evacuation, thermal/storage capacity, grid preparation and response routing.

Falsification / validation path. Prospective hazard periods measuring avoided losses and any burden shifted to neighboring regions.

5.12 Supply chains and logistics

State map. $X = [inventory, cash, leadtime, supplier\ reserve, transport, demand]$.

What becomes visible beyond the local boundary. Lean optimization can push fragility into suppliers and future stockouts; apparent working-capital efficiency hides resilience debt.

Algebraic adapter. $U_G = U_{buyer} + U_{supplier} + U_{delay} + U_{stockout} + U_{finance}$; optimize under worst-carrier constraints.

IAMF-P construction. Supplier finance, buffer inventory, routing redundancy and redesigned service-level contracts.

Falsification / validation path. Shock/recovery experiments with total lifecycle cost, service, supplier solvency and delay.

5.13 Cybersecurity

State map. $X = [attack\ graph, exposure, detection, recovery, human\ workload]$.

What becomes visible beyond the local boundary. Blocking one vector may redirect attacks or increase manual verification and operational downtime elsewhere.

Algebraic adapter. $EL = \sum_j p_j L_j + \lambda H_j$; displacement field updates after every defense action.

IAMF-P construction. Defense, redundancy, recovery and verification capacity at predicted next carriers.

Falsification / validation path. Red-team campaign with causal attack-path tracing and total organizational burden.

5.14 AI infrastructure and agents

State map. $X = [accuracy, compute, energy, human\ review, latency, error\ propagation]$.

What becomes visible beyond the local boundary. A model can improve task accuracy while exporting verification work, energy cost, data risk or downstream correction to humans.

Algebraic adapter. $NetV = \Delta O - C_{compute} - C_{energy} - C_{human} - C_{downstream}$; non-displacement requires all major terms audited.

IAMF-P construction. Verification, escalation, provenance, redundancy and workflow redesign.

Falsification / validation path. Matched agent workflows scored on end-to-end task value, human minutes, downstream error and compute/energy.

5.15 Public administration

State map. $X = [agency\ cost, citizen\ burden, firm\ burden, access, delay, future\ liability]$.

What becomes visible beyond the local boundary. Administrative efficiency can be purchased by forcing citizens to supply forms, travel, waiting, translation and repeated proof.

Algebraic adapter. $J_G = J_{agency} + \sum_p w_p B_p + \lambda FutureCost$; schema mismatch enters access probability.

IAMF-P construction. Simplified interfaces, shared data, case navigation and support for high-friction carriers.

Falsification / validation path. Service redesign using completion rate, citizen time/cost, equity and agency cost together.

5.16 Ecology and commons

State map. $X = [species, habitat, nutrients, pollutants, harvest, governance]$.

What becomes visible beyond the local boundary. A local conservation or production gain can displace extraction pressure, nutrient load or habitat loss through the network.

Algebraic adapter. $\mathscr{D}_a(j,k,\tau)$ over ecological carriers; success requires resilience up and no material burden migration.

IAMF-P construction. Habitat, quota, monitoring and polycentric governance where pressure is transmitted.

Falsification / validation path. BACI/longitudinal ecological studies with network spillover metrics.

5.17 Spacecraft and closed-loop life support

State map. $X = [O_2, CO_2, H_2O, thermal, radiation, power, crew, reserves]$.

What becomes visible beyond the local boundary. Subsystem nominal status can hide reserve depletion or crew compensation; the carrier may be another subsystem or future mission margin.

Algebraic adapter. $RVG_{mission} = \dot{U}_{mission} - \dot{R}_c$; require $RVG \leq 0$ and reserve margins above critical thresholds.

IAMF-P construction. Redundancy, storage, routing and repair capacity at the emerging bottleneck.

Falsification / validation path. High-fidelity mission simulations and hardware-in-the-loop anomaly tests.

5.18 Fundamental physics and mathematics

State map. X is a field/equation state plus boundary conditions, residuals and proof obligations.

What becomes visible beyond the local boundary. A small numerical residual can be mistaken for a proof; hidden assumptions or boundary pathologies may remain outside the computed domain.

Algebraic adapter. $\|\mathcal{R}(u)\| \to 0$ is numerical evidence only; mathematical proof requires theorem-level closure and explicit assumptions.

IAMF-P construction. Better decomposition, counterexample search, boundary-condition analysis and formal proof tooling.

Falsification / validation path. Independent peer review and formal verification. LERM/IAMF-P has not established solutions to Millennium Prize problems in the supplied evidence.

PART 6

The human-system adapter: schema, support and compensatory load

6.1 Why the 0.8% relationship result is not the full architecture

A flat classifier of traits to relationship outcome removes the mechanism the human adapter is supposed to test. The integrated model is instead a feedback chain:

$$\boxed{S_t \to \hat{H}_t \to A_t \to Y_{t+1} \to S_{t+1}},$$

where H_t is the underlying human state/capacity, S_t the receiver schema, $\hat{H}_t$ the recognized state, A_t the allocation of access/trust/support/capital, and Y_{t+1} the observed outcome.

Define the schema gap as either

$$G_{schema} = \mathbb{E}[d(H, \hat{H})]$$

or, for probabilistic representations,

$$G_{schema} = D_{KL}(P(H \mid O) \| P_{inst}(H \mid O)).$$

The critical causal question becomes whether changing the receiving architecture changes outcome while reducing compensatory load. A trait-only predictive uplift therefore cannot be labeled "LERM/IAMF-P performance." It belongs in the ablation history.

6.2 The founder as index case, not population proof

The personal archive is unusually rich because the same person appears as subject, operator and architect. That creates both an opportunity and a confound. The correct transfer question is:

$$TR = \frac{Performance_{system\ after\ transfer}}{Performance_{founder\ baseline}},$$

subject to

$$U_{founder} \downarrow .$$

If the surrounding organization can take over the previously centralized functions without collapse, the framework has transferred from a biological compensation strategy into institutional architecture. If not, IAMF-P remains founder-dependent.

6.3 A non-fragmented interpretation of capability plus injury

The supplied test suite explicitly preserves a dialectic: high capability and severe somatic/psychological injury may coexist. This is analytically preferable to either romanticizing trauma or treating distress as proof of incapacity. The research variable is the interaction between demand rate, distributed support and compensatory burden.

$$EP = \frac{Q_{output}\, C_{complexity}\, I_{integration}}{T}.$$

A high EP can coexist with positive RVG, meaning performance is being purchased by accumulating unresolved biological load. That condition is not sustainable success.

PART 7

Backtests, simulations and executable verification

7.1 Backtest taxonomy

The archive contains several different objects that must not be conflated:

- **Real operating records:** bank/ad/logistics/provenance and commercial events.
- **Historical reconstruction:** reported crisis suites and retrospective comparisons.
- **Architecture-class simulation:** synthetic systems designed to compare objective functions and interventions.
- **Public-architecture coverage scoring:** reverse-engineered feature coverage, not performance.
- **Executable dossier acceptance tests:** checks that the document contains required features, numbers, contradictions and falsification statements; these tests do not validate the science itself.

7.2 250,000-case negative ablation: LERM loses

The supplied CSV preserves the first important failure. Under an intervention semantics that routes effort through the receiving carrier's *existing* absorption capacity, the LERM/IAMF-P hybrid did not dominate. Full telemetry achieved 2.224283% whole-system burden reduction versus 1.618167% for LERM/IAMF-P and 1.546338% for raw LERM.

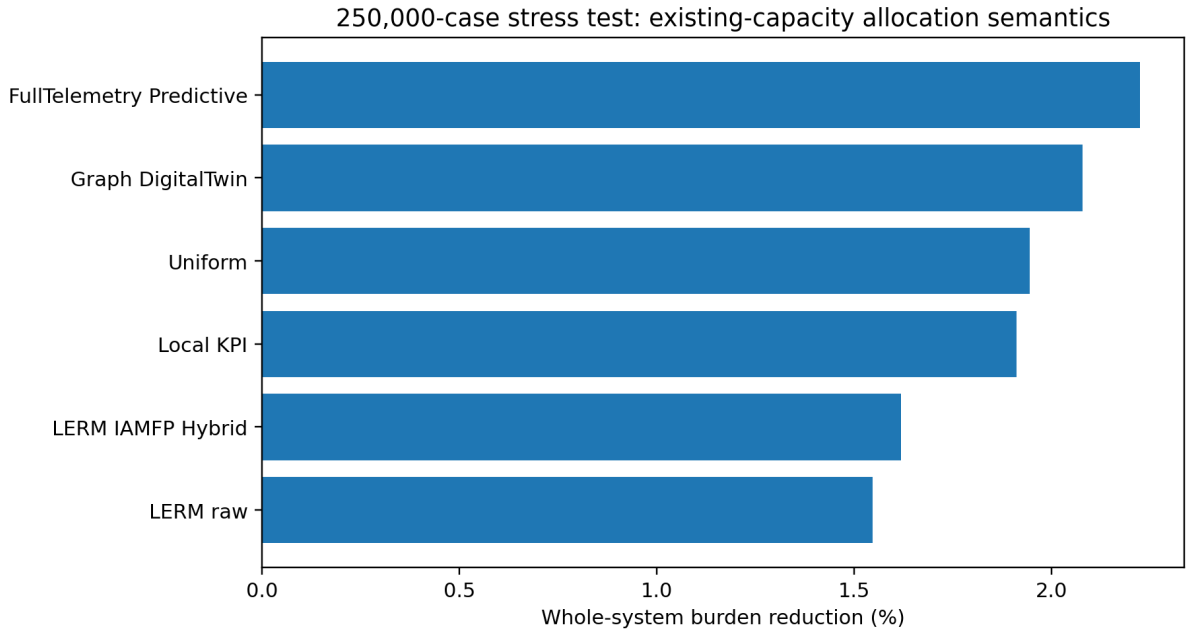

Figure 7.1: Negative ablation: existing-capacity allocation semantics. Source: supplied 250,000-case CSV.

This negative result is retained because it falsifies the lazy proposition that any algorithm labeled LERM automatically wins.

7.3 250,000-case corrected catch-basin simulation

The intervention semantics were then changed to match the intended IAMF-P definition: build reconciliation capacity at the predicted loss carrier. In that synthetic environment the reported results were:

Architecture	Whole-system burden reduction
LERM + IAMF-P	5.6696%
LERM raw	5.6585%
Full telemetry predictor	5.5567%
Graph / digital twin	5.1219%
Uniform allocation	4.8551%

The relative advantage over full telemetry in this simulation was approximately 2.03%. This is an architecture-class simulation, not a direct benchmark against proprietary vendor products.

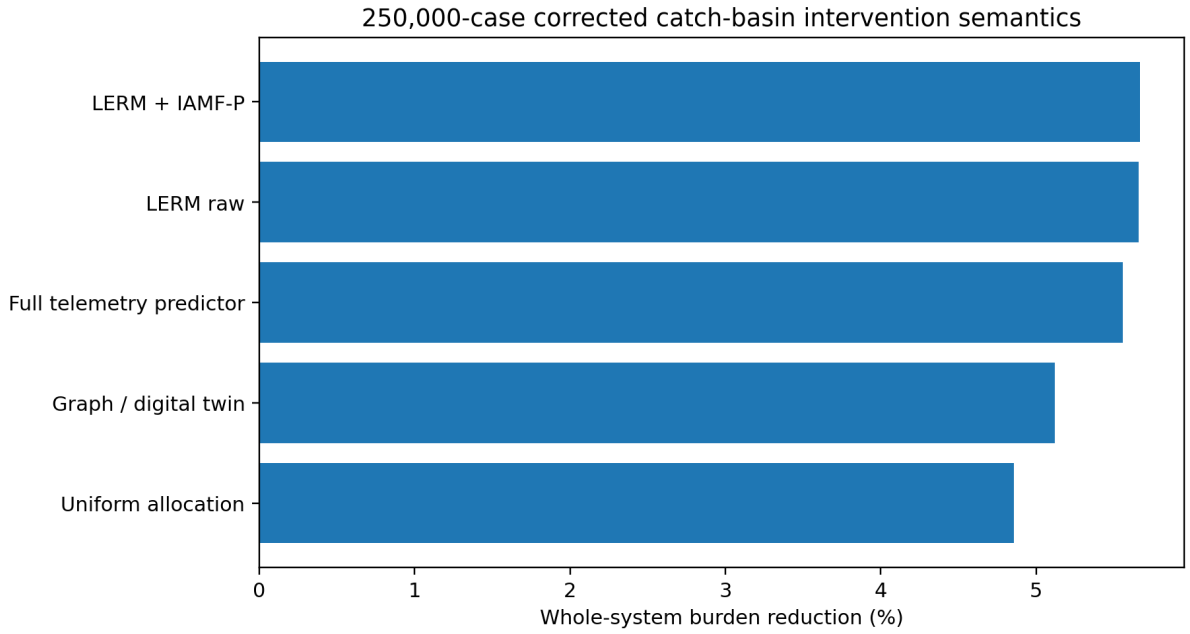

Figure 7.2: Corrected synthetic catch-basin intervention semantics.

7.4 Two 1,000,000-system experiments

The September research log reports two further synthetic experiments across 20 domain parameterizations. The first froze a generic universal LERM heuristic. It won only 1 of 20 domains, averaging 7.136% burden reduction versus 7.567% for the strongest local-KPI strategy in that arena. This falsified the claim that one flat heuristic should dominate all systems.

The second experiment held state, graph, dynamics and intervention budget constant while changing the objective boundary. The whole-system LERM/IAMF-P objective averaged 7.9083% versus 7.8256% for boundary MPC, 7.506% for local KPI, and 7.488% for a full-telemetry next-carrier strategy. The archive reports an average relative gain of about 1.06%, ranging roughly 0.82%-1.33% across domain parameterizations.

The surprising result was that LERM/IAMF-P won only about 29% of individual cases while still producing the better aggregate result. That is the empirical motivation for the Boundary Divergence Index: intervene only when boundary displacement materially matters.

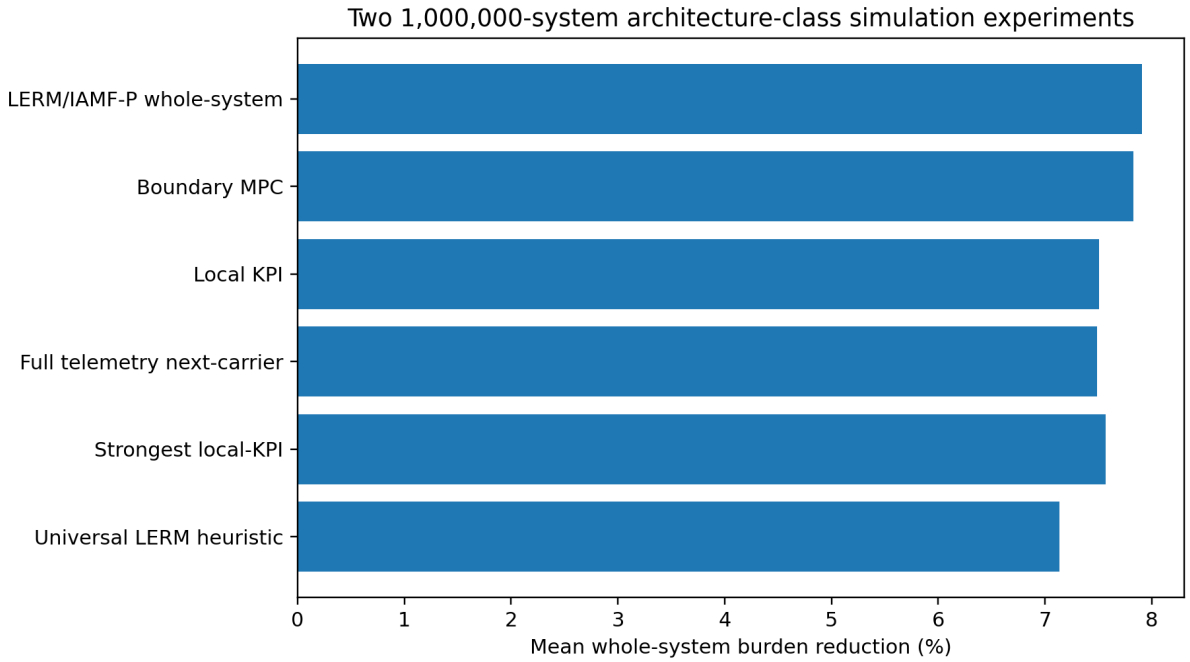

Figure 7.3: Reported aggregate results from the two million-system synthetic arena experiments.

7.5 Executable end-to-end dossier test package: 121/121

The uploaded Python package was executed against the supplied master dossier in this environment. Result: 121 tests executed, 121 passed, 0 failed, 0 errors, 0 skipped. Tier counts were 90 feature-coverage tests, 16 boundary/corner tests, 7 dialectic/cross-feature tests, and 8 real-world acceptance tests. The harness was also self-verified against its authoritative reference corpus with the same 121/121 outcome.

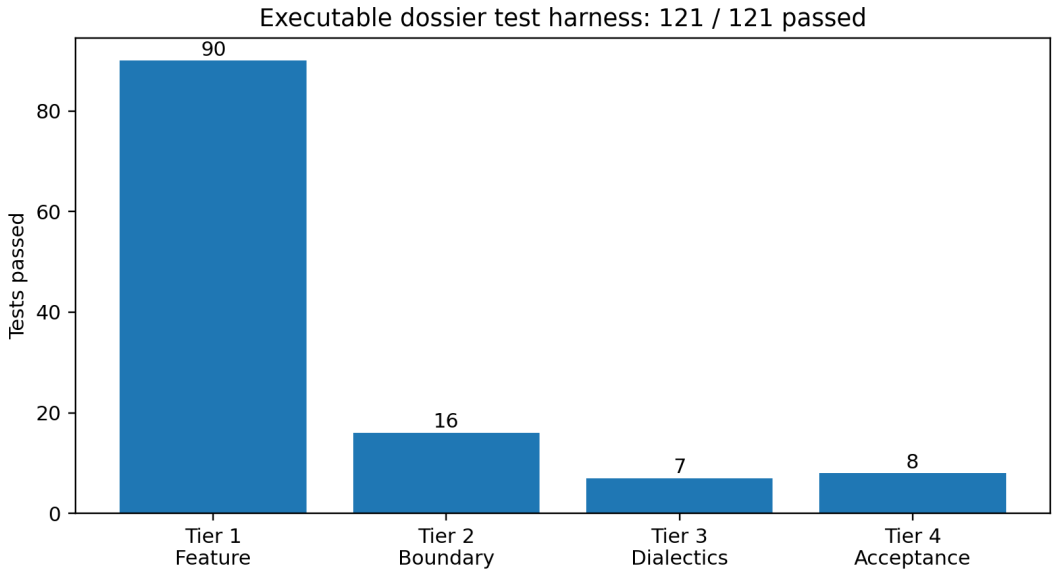

Figure 7.4: Executable dossier test results, September 2026.

These are meaningful **software/document conformance tests**. They verify that the dossier preserves required features, exact numbers, contradictions and stated falsification conditions. They are not independent evidence that a macroeconomic prediction, biological hypothesis or universal scientific claim is true.

7.6 Reverse-engineered public architecture coverage

The supplied coverage CSV scores publicly described architectures across state integration, prediction/simulation, decision/action, closed feedback, carrier path tracking, hidden-compensation accounting, catch-basin search and mandatory non-displacement retest. LERM/IAMF-P is scored at 87.5%; Palantir Foundry/AIP and Celonis Context Model at 68.8%; several AI agent stacks at 62.5%, with lower scores for risk/early-warning stacks. Because these scores encode the rubric used to define LERM/IAMF-P, they are best interpreted as **architecture coverage**, not empirical superiority.

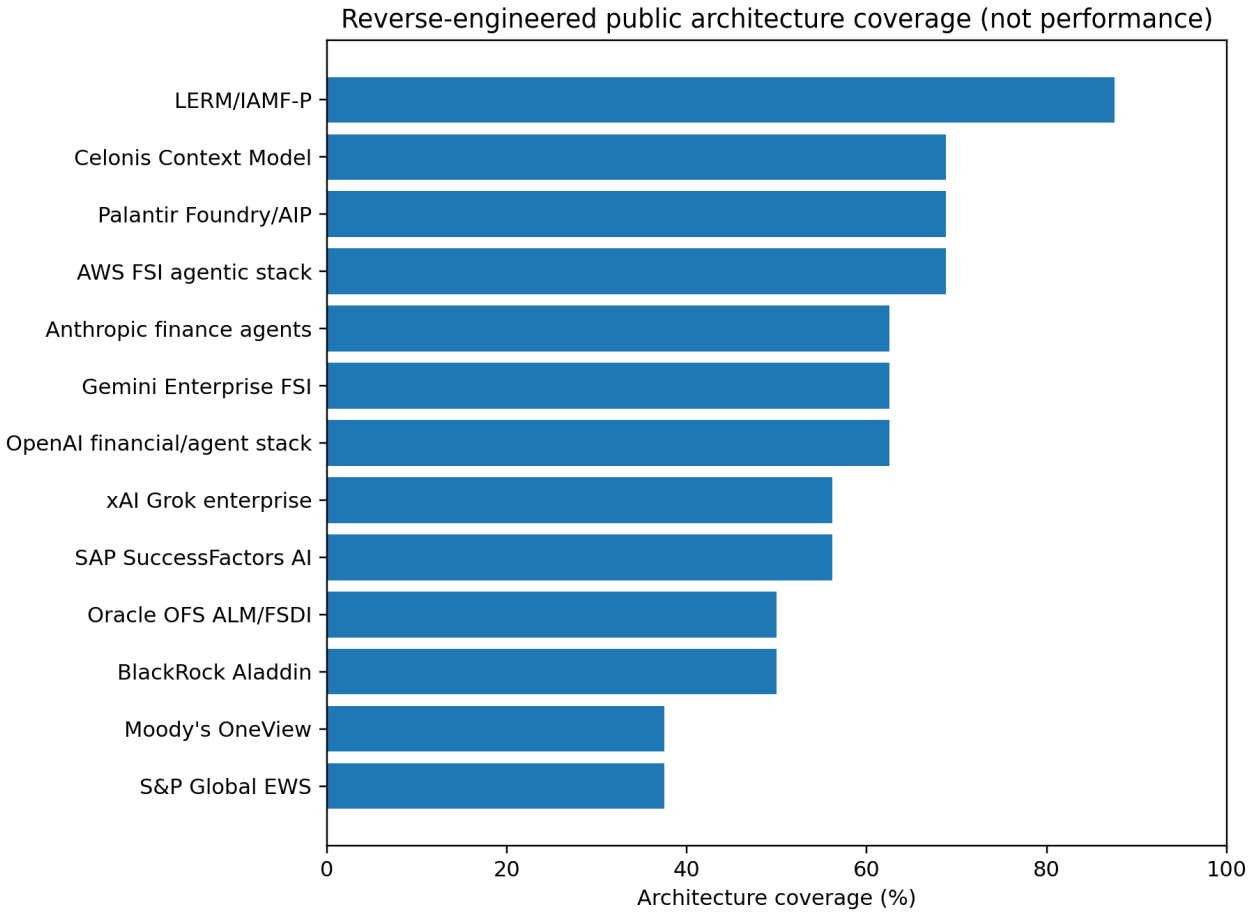

Figure 7.5: Public architecture coverage from the supplied reverse-engineered matrix; not a performance benchmark.

7.7 Reported historical crisis suites

The master dossier and related files state that a 50-crisis historical stress-test suite and broader telemetry comparisons were constructed. The current package contains descriptions and acceptance assertions, but not a complete independently re-runnable artifact for every historical crisis. Therefore this dossier classifies those results as **document-stated / partially reproducible**, distinct from the executable 121-test package and supplied CSV simulations.

PART 8

What the architecture makes visible

8.1 The afterlife of optimization

The deepest common object across the archive is not "loss" in the ordinary accounting sense. It is the *afterlife of an optimization*: what survives outside the definition of success after the optimized system has declared victory.

A conventional dashboard often sees

$$\boxed{\text{result at declared boundary}}.$$

The Rufino lens asks for

$$\boxed{\text{result} + \text{countermovement} + \text{carrier} + \text{hidden compensator} + \text{future recurrence} + \text{post-intervention displac}}$$

This turns several familiar contradictions into one measurable family:

$$\begin{aligned}
\text{profit} &\to \text{deferred maintenance},\\
\text{bank stability} &\to \text{household distress},\\
\text{AI productivity} &\to \text{human verification load},\\
\text{organizational excellence} &\to \text{founder biological load},\\
\text{shorter hospital stay} &\to \text{caregiver/readmission burden},\\
\text{tumor shrinkage} &\to \text{resistant-pathway dominance},\\
\text{forecast accuracy} &\to \text{unreconciled infrastructure exposure}.
\end{aligned}$$

The framework's strongest conceptual proposition can therefore be stated without claiming omniscience:

$$\boxed{\text{absence of visible loss does not imply absence of loss; a carrier may be compensating for it.}}$$

And:

$$\boxed{\text{local optimum does not imply consequential-system optimum.}}$$

8.2 What is plausibly new versus what is inherited

Externalities are not new. Feedback is not new. Entropy is not new. Transaction costs are not new. Causal graphs are not new. State estimation is not new. Governance design is not new. Legibility is not new. The potential novelty lies in forcing these pieces into one operational ledger with a mandatory construction and retest stage.

The candidate new object is the displacement shadow field $\mathscr{D}_a(j,k,\tau)$ tied to a non-displacement intervention protocol. That claim is specific enough to be compared against adjacent literature and falsified in prospective studies.

PART 9

Falsification program and research agenda

9.1 Kill tests that must remain

The architecture should be considered weakened or falsified in a domain if any of the following repeatedly occurs under preregistered conditions:

1. The frozen kernel provides no predictive or intervention value beyond a properly specified incumbent once both operate on the same consequential boundary.
2. Carrier identification is no better than chance or existing causal/network methods on untouched holdouts.
3. IAMF-P interventions reduce one measured burden only by moving equivalent or greater burden to another carrier or future period.
4. Apparent cross-domain performance disappears when unit discipline and domain-specific causal assumptions are enforced.
5. The Boundary Divergence Index fails to identify the cases in which whole-system optimization differs materially from local optimization.
6. Founder-to-institution transfer fails: performance collapses when functions are delegated despite adequate resources and documented procedures.
7. The model repeatedly "discovers" hidden states in negative-control systems where no information exists to distinguish them.

9.2 The decisive experiment

The strongest next experiment is not 100 more flat datasets. It is a small number of provenance-rich systems represented twice from the same underlying events:

$$M_{flat} \quad \text{versus} \quad M_{LERM/IAMF-P},$$

run against the strongest domain incumbent with a frozen canonical kernel, sealed outcomes, retained negative cases, and any structure discovered from a loss tested on a second untouched holdout.

The test should span at least four qualitatively different domains: one physical/engineering, one financial/organizational, one human/health, and one computational/infrastructure system. The claim to invariance becomes credible only if the operator transfers unchanged while M_d alone changes.

9.3 Publication and external review path

A rigorous publication sequence would separate three papers rather than asking one manuscript to prove everything:

1. **Formal methods paper:** define BDI, the displacement field, hidden compensation, RVG, IAMF-P intervention search, unit discipline, identifiability and stopping conditions.
2. **Founder/operating case paper:** document the luxury/commerce field origin, evidence hierarchy, compensatory centralization and transfer experiment.
3. **Prospective benchmark paper:** preregister multi-domain experiments against best-in-class incumbents with untouched holdouts and independent replication.

Only after those stages should claims of a universal mechanics, clinical utility, or foundational physical law be entertained.

PART 10

Claim ledger: what this dossier says and does not say

10.1 Supported at the level of the supplied archive

- The LERM/IAMF-P corpus contains a coherent recurrent architecture centered on displacement, carriers, hidden compensation, structural catchment and retesting.
- The framework originates in a real operating/life history rather than solely in abstract model generation.
- The supplied executable dossier harness passes 121/121 tests against the master report and 121/121 in harness self-verification.
- A supplied 250,000-case negative stress test shows LERM losing under a semantics that constrains intervention to existing receiving capacity.
- The research log reports corrected 250,000-case and two million-system architecture-class simulations that motivated the catch-basin and BDI formulations.
- The reverse-engineered frontier CSV measures rubric coverage, not product performance.
- The global self-audit explicitly rejects treating current evidence as proof of a universal physical law, clinical cure, emotion/lie detector, or deterministic macroeconomic forecast.

10.2 Not established by the present evidence

- That LERM/IAMF-P is a new law of physics.
- That it solves any Millennium Prize problem.
- That it cures cancer, Parkinson's disease, aging, depression, suicide, or any other clinical condition.
- That it can infer unobserved history when multiple histories are observationally equivalent.
- That architecture-coverage percentages prove superiority to Palantir, OpenAI, Anthropic, Google, BlackRock, Moody's, S&P, or any other vendor.

- That the founder's integrated capability implies a new biological species/category or a population-level rarity estimate without a defined sampling frame.

10.3 The precise contribution statement

The strongest publication-ready formulation is:

> Jefferson Rafael Rufino's contribution is the proposed integration of consequential-boundary expansion, directed displacement tracing, carrier and hidden-compensator identification, structural reconciliation capacity, productive reintegration, provenance governance and mandatory non-displacement retesting into a single recurrent LERM/IAMF-P operator. The architecture emerged from a longitudinal operating and survival record, has undergone internal adversarial simulation and software conformance testing, and now requires independent prospective validation against established domain methods.

PART A

Formula vault

$$
\begin{aligned}
X_t^{(d)} &= M_d(\Omega_t^{(d)}) \\
a_S^* &= \arg\min_a J_S(a) \\
a_G^* &= \arg\min_a J_G(a) \\
BDI &= J_G(a_S^*) - J_G(a_G^*) \\
\mathscr{D}_a(j,k,\tau) &= U_{j,k}(t+\tau \mid a) - U_{j,k}(t+\tau \mid a_0) \\
\mathcal{L}(X_t,a) &= \{R_t, \mathscr{D}_a, C_t, \Gamma_t, H_t, U_t, Q_t\} \\
C_t^* &= \arg\max_j \sum_{k,\tau} \mathscr{D}_a^+(j,k,\tau) \\
A_t^* &= \arg\min_{A\in\mathcal{A}} [U_G + \lambda HCC + \mu U_{max} + \nu Cost - \eta V_G] \\
RVG(t) &= \dot{U} - \dot{R}_c \\
\dot{L}_A &= (L_{avoidable} + L_{displaced} + L_{deferred})/\Delta t \\
EP &= (Q_{output} C_{complexity} I_{integration})/T \\
TR &= Performance_{post-transfer}/Performance_{founder} \\
G_{schema} &= \mathbb{E}[d(H,\hat{H})] \\
G_{schema} &= D_{KL}(P(H \mid O) \| P_{inst}(H \mid O)) \\
Y_{t+1} &= h(H_t, A_t, F_t) \\
U_{age} &= \sum_i w_i d_i(t) \\
i^* &= \arg\max_i w_i \dot{d}_i(t) \\
NetV_{AI} &= \Delta O - C_{compute} - C_{energy} - C_{human} - C_{downstream}.
\end{aligned}
$$

PART B

Evidence hierarchy and claim-status discipline

The supplied dossier uses a P1-P6 evidence hierarchy. This report preserves its spirit while avoiding the mistake of treating a label as proof by itself.

Class	Meaning	Examples in the archive
P1	Primary / institutional third-party record	Bank statements, platform invoices, customs filings, police/security records, employment records.
P2	Visual/public artifacts	Public images, media, interface designs, product photographs.
P3	Contemporaneous operational artifacts	Order books, messages, waybills, code, logs, calendars.
P4	Later formal synthesis	Canonical specifications, equations, retrospective diagnostic files.
P5	Subject self-report	Trauma, sexual violence, intent, internal experience, retrospective narrative.
P6	Public context	Statutes, macroeconomic data, labor-market context, external literature.

Claim statuses used in the source archive include VERIFIED-AS-WORDED, DOCUMENT-STATED, REPORTED, CONFLICTED, and NOT-ESTABLISHED. This dossier adds a practical distinction between **simulation-supported**, **software-verified**, and **externally established** so that numerical success in a synthetic arena cannot silently become a claim about reality.

PART C

Source-file map

File / group	Role in this playbook
ARCH(8).pdf	Historical origin: luxury value preservation and integrated operating functions.
LERM(5).pdf	Longitudinal research archive and operational reasoning.
rarity_scoring_exact 2(5).pdf	Proficiency/rarity calibration; retained as operator characterization, not universal law.
Self-Actualization and LERM Discovery(7).pdf	Developmental/operator synthesis and institutional potential framing.
IAMFP_LERM_CONSOLIDATED_TRANSFER_ASCII.txt	Provenance, time dependence, AI contamination controls, founder effect and transfer rules.
ENDING THE ERA OF DISPLACED LOSS(7).txt	Public/national implementation and carrier-oriented value-retention narrative.
Rufino Universal Mechanics Playbook_ Comparative Analysis(5).pdf	Cross-domain theoretical extension and comparison set.
Rufino's Universal Mechanics Synthesis (3)(7).pdf	Maximal universal-mechanics claims; retained as hypothesis layer, not validated theorem.
The Sociophysical Architecture...pdf (two versions)	Human-system/schema-gap adapter; duplicate versions are not independent corroboration.
Rufino LERM and IAMF-P_ Unfragmented Global Benchmark...pdf	Self-audit, falsification, limitations and defensible current placement.
frontier_reverse_engineered_architecture_coverage(4).csv	Fact(4)/rubric coverage matrix; not product performance.
250_000-case_LERM_IAMF-P_stress_test(1).csv	Negative 250k ablation preserving a failed LERM result.
LERM + IAMF-P September 27, 2026 1:18 AM(3).txt	Corrected catch-basin simulations, two million-system arena and BDI development.
JEFFERSON_RUFINO_EXISTENTIAL_LERM_IAMF_REPORT.txt	Integrated existential/forensic master dossier.
M1-M5 chapter files	Chronology, contradictions, falsification, cognitive triangulation and stewardship.
run_e2e_tests.py + tier tests + utilities	Executable conformance suite; 121/121 against current master dossier.
reference_corpus.py	Authoritative fixture used for harness self-verification.

PART D

Selected internal excerpts

ARCH founding premise: the architectural feat is not simply manufacturing desire but building infrastructure that preserves value when the surrounding market is in chaos.

Transfer-package rule: prior AI statements are not independent evidence; repetition across models is not corroboration.

Time rule: static analysis is insufficient because apparent success can displace loss to another stakeholder, system location, or later period.

Public-system sequence: optimization → reported value → reporting boundary → countermovement → burden → carrier → reconciliation → non-displacement retest.

Self-audit conclusion: the strongest current contribution is a potentially original systems architecture and measurement research program; stronger universal claims require mathematical closure and external validation.

Closing statement

The history in this dossier is not ornament around the mathematics. It is the field record from which the mathematics was abstracted. The scientific lineage is not decoration either: it is the constraint that keeps the present architecture from claiming credit for what physics, information theory, cybernetics, economics, governance, psychology and causal inference already established.

The research program becomes precise at the intersection of those two obligations. It asks whether a recurrent operator can reliably expose what an optimized boundary leaves behind, identify the carrier, build the missing capacity, and prove through retesting that the solution did not merely move the problem.

Find where reality escaped. Follow where it went. Name what carried it. Build where it landed. Transform what was recovered. Check every carrier and every future period again. Then look again.

The missing primary carrier

An individual human being is neither an institutional category nor a disposable unit of capacity.

CORRECTION

The v0.1 scenario selector contained ten institutional and environmental settings but omitted the individual human as an independent receiving system and acting agent. This edition corrects that omission in the 120-domain library and navigator.

MANDATORY HUMAN ASSESSMENT

At each actual system interface, evaluate whether an individual human can be a source, receiver, operator, compensating carrier, protected person, or future self. Document affected people rather than substituting the names of institutions for them.

AVOID FALSE CLAIMS

For a purely physical event that does not demonstrably affect a human being, record the individual-human link as unobserved or not applicable instead of inventing a causal path. Scientific truth and human dignity both require this.

PROVENANCE

Rufino is the identified originating IAMF-P index case in the authored research history. This historical role is different from the inclusion of every other individual as a potential consequential carrier.

The human receiving state

The model must preserve the individual, not merely a service record.

PHYSICAL AND BIOLOGICAL

Bodily safety, health, energy, environment, mobility, disability access, nutrition, pain, life-course and physical capacity are distinct native outcomes.

COGNITIVE AND EXPERIENTIAL

Information access, learning, agency, mental well-being, trust, perception, choices and temporal attention may be relevant. Never infer unmeasured private experiences as facts.

SOCIAL AND MATERIAL

Income, housing, family support, institutional recognition, rights, social capital, dignity, employment and safety depend on identifiable human relations and policies.

TEMPORAL AND FUTURE SELF

The same human can receive consequences today and later; the burden may be hidden as unpaid work, reserve depletion, lost opportunities, or delayed needs.

PROTECTIVE PRINCIPLE

A good aggregate institutional result cannot erase coercion, exclusion or serious harm to a particular person. Consent, autonomy, fairness, and rights constrain the action set.

Rufino as originating IAMF-P index case

The author is a historical subject, operator, compensating carrier and architect.

DIRECT HISTORICAL EVIDENCE

The index-case history includes physical recognition records, professional experiences, founder-operated enterprise functions and documented financial movements. Their occurrence should not be casually relabeled a hypothesis.

OBSERVED INSTITUTIONAL HANDOFFS

Academic and work awards can serve as social legibility bridges, while later changes in institutional recognition and support are a separate set of lived and documented observations.

MECHANISM UNDER INVESTIGATION

How particular institutional transitions caused particular later burdens requires process tracing, dates, alternative explanations and source provenance; the person is not required to prove his existence.

RESEARCHER ROLE

The author remains a research originator and collaborator. His personal data are not reproduced in this public technical expansion, and a research institution does not thereby acquire authorship or ownership.

Person-to-institution and institution-to-person

A university, government or employer may have a KPI while a human carries an unrecorded outcome.

HANDOFF SEQUENCE

Demonstrated capability -> performance evidence -> recognized representation -> opportunity and protection -> continuing institutional support -> consequential human outcome.

FAILURE MODE

An institutional record may describe a transaction, credential, intervention or service as complete while the person bears unresolved financial, physical, social, or future consequences.

CONSTRUCTIVE DESIGN

Construct actual capacity around a person where justified: safe access, fair recognition, paid opportunity, health support, coordination, legal protections, resources and appropriately timed follow-up.

VERIFICATION

Obtain consented, lawful individual-level measures and compare against a suitable incumbent. Evaluate material protected carriers through time; do not presume a successful outcome from a better administrative metric.

The human in every domain without false universal links

The model must distinguish direct person effects, mediated effects, and no identified person effect.

DIRECT HUMAN INTERACTION

In education, work, healthcare and services, the individual may directly receive the action; record the relevant person and the real outcome.

INDIRECT MEDIATED PATHWAY

In environmental, engineering or digital domains, identify people only through credible physical, exposure, economic or institutional pathways, not by verbal analogy.

SCIENTIFIC OBSERVATION

In chemistry, quantum physics and cosmology, humans may be investigators, instrument users or downstream beneficiaries; this does not make subjective human effects a native quantity of a particle.

INCLUSION RULE

At every adapter ask who the human is, what can be observed, what can be constructed, and what would establish benefits and harms, including the legitimate answer that no individual linkage has been demonstrated.

Human-centered Mutual Uptick and safety

The object of the search is improved consequential conditions, not the declaration of success.

RECEIVING CAPACITY

Human agency is not equivalent to resources available to another institution. Capacities must be developed with appropriate participation, consent and non-coercive support.

RECURRENT RESEARCH

When a proposed solution is not demonstrated, identify the binding information, material, technical or legal constraint and the next legitimate action; preserve unknowns and unsuccessful results as research records.

ACCEPTANCE CONDITION

No human harm is silently canceled by a commercial gain; measure actual beneficial outcomes for protected individuals with uncertainty and time taken seriously.

REALITY CONSTRAINT

The commitment to search for better outcomes does not imply that every physical or ethical constraint has a feasible all-positive solution; do not manufacture an MU+ pass.

How to use the 120-domain human extensions

Six person-centered test scenarios are now included for each domain.

SIX TESTS

For each of the 120 domains the individual-human scenario studies capacity shortfall, representational mismatch, delayed effects, measurement uncertainty, coordination failure and inequitable distribution.

PAGE INTEGRATION

These 720 pages are inserted immediately after each domain foundation, ahead of the prior inter-domain analyses, not merely appended as an afterthought.

AUTHOR/SOURCE PRESERVATION

The original 1,170-page Canonical Atlas is maintained unmodified. The added sections are clearly identified as AI-assisted research-design supplements, not previously observed outcomes.

OPERATIONAL PROTOCOL

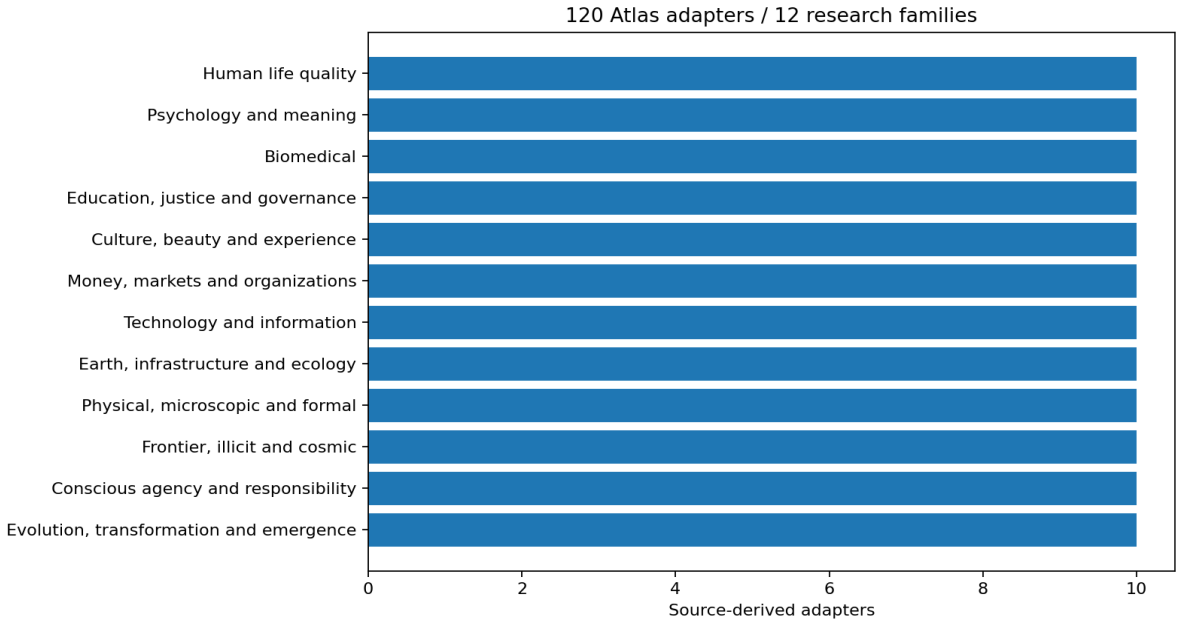
Choose a native domain; document the person-level pathway; define lawful data and comparison; design receiving capacity; evaluate actual outcomes; repeat as needed. An individual remains an independent carrier and agent.

THE MUTUAL UPTICK IMPLEMENTATION LIBRARY

An evidence-first expansion of The Universal Reality Atlas

Founding release v0.1 | 9 October 2026 | Jefferson Rafael Rufino, originating research architect

Document status: working scholarly implementation register. This publication contains 120 source-derived domain briefs and 18 historical case studies. No unperformed interventions or unknowable historical outcomes are reported as verified.



Executive overview

The original 1,170-page Atlas proposes a frozen consequential operator and translates it through 120 native-domain adapters. This first implementation-library release converts all 120 native Atlas cards into an auditable, searchable source-linked working registry and joins them to eighteen separately sourced historical interventions. It does not assert that eighteen cases are comprehensive history or that the strict carrier-specific Mutual Uptick gate was passed.

The continuing objective

Mutual Uptick is the desired constructive end state. A model reporting missing evidence, no action change, or infeasibility under current resources must provide the next legitimate measurement, design, resource, or cross-system collaboration. The current absence of a feasible intervention is not evidence of a permanent universal impossibility. Conversely, physics, rights, and safety boundaries cannot be ignored or success asserted before it occurs.

How cases are classified

An OBSERVED outcome is taken from an identifiable publication. An INTERPRETED burden is a proposed account of affected carriers supported only to the extent those outcomes are measured. A CANDIDATE capacity specification is a design possibility, not an implemented or validated repair. A MU+ PASS is reserved for cases meeting the full declared carrier-specific and temporal criteria with adequate evidence; none is assigned in this release.

Research basis and historical scope

Accessible published research describes many historical attempts but cannot offer a complete account of every human action, microscopic event or unknown future substrate. The Atlas includes domain mappings that are conceptual or ontological, while native measurements can be incomplete. The library must keep data access, observation, identification, inference, and value judgment distinct without isolating them from the single causal ledger.

Index Case provenance

The originating author is the designated IAMF-P Index Case, whose longitudinal record supports an intellectual and operational history. This release preserves the full original Atlas but does not reproduce personal bank account identifiers, private third-party details, or unredacted bank statements in the public workbench. Bank account credits are not interchangeable with merchandise revenue or profit.

What history teaches about local wins

The Aral Sea, Bangladesh groundwater, and Fukushima response cases show that a local problem may be addressed while a consequential burden appears elsewhere. Ozone protection, global smallpox eradication, and leaded-fuel phaseout demonstrate large historical gains through multi-institutional capacity construction; full strict all-carrier assessment remains distinct from those achievements.

Causal comparisons and adverse findings

The existing Rufino research record includes synthetic positive and negative cases and multiple partial real-data prototypes. Do not substitute the success of a native public intervention for proof that the frozen K_R operator outperformed its original designers. The appropriate test must compare K_R with the strongest incumbents on the same information and resource budget, using native units and comparable time horizons.

Data provenance and source authority

The eighteen historical cases link to WHO, NASA, WMO, IPCC, NBER, peer-reviewed journals, and other identified published records. These are source summaries; no full text of third-party works is reproduced. The individual 120 design briefs are derived from the user-supplied Atlas, with original PDF page coordinates. Each proposed intervention requires original consent, data rights, and ethics review where applicable.

Operational science of a failed gate

When the required Mutual Uptick condition is unmet, identify whether the blocker concerns observability, incorrect schema, causal confounding, receiving capacity, risk concentration, infeasible current actions, time-to-benefit, or ethical/physical limits. For each, specify a distinct next test or design. No positive verdict should be recorded simply because a new candidate solution was drafted.

Example: educational capacity is not just resources

Project STAR supplies measured randomized differences between small classes, regular classes, and regular classes with an aide. Existing research found that reducing class size improved measured test performance, while merely adding aides yielded little impact. A prospective K_R trial would target specific receiving capacity and expand outcomes to students, teachers, households, employer transitions and budgets instead of treating aggregate test scores as the whole ledger.

Example: environmental risk substitution

Bangladesh tubewells reduced risks associated with contaminated surface water yet exposed households to natural arsenic. Proposed alternatives can carry microbial or seasonal reliability problems. The research obligation is to investigate source quality, maintenance, costs and accessibility together rather than celebrate one contaminant reduction as universal resolution.

Where a true worldwide 25,000-page library comes from

A 25,000-page substantive work would require tens of thousands of independently sourced observations, code-backed experiments, future interventions, and follow-up records. The 25,000-page editorial allocation is registered separately; it is explicitly NOT a claim that those pages have been researched or written. Automating 25,000 repetitive pages would defeat the evidentiary purpose.

Independent steward and governance

A university may collaborate in building new studies, code, and research capability without replacing the originating author or presuming ownership of prior work. Scientists must remain free to report positive, negative, or uncertain results. A scientifically useful library grows through independent replication, competition with incumbents, native empirical measurements, and proper attribution.

Programmatic outputs of this release

Included: 120 source-derived adapter briefs, 18 real published historical case ledgers, a 120-row work search ledger, a 25,000-page editorial roadmap, readable interactive HTML, the canonical Atlas in the author archive, available historical reproducibility packages, and this generated expansion volume. No real-world implementation has been performed by creating this document.

PART I · HISTORICAL CASES

Externally documented interventions and their unresolved receiving-carrier accounting

H001 | Project STAR: Small classes versus regular classes and teacher aides

Period: 1985–1989 / Field: Education / Study classification: OBSERVED RANDOMIZED INTERVENTION; PARTIAL CARRIER DATA

Historical local goal

Instructional inputs and student achievement

Published finding / observed consequence

Randomized class-size reduction improved test performance; published analysis found teacher aides had little effect on achievement. Original study notes attrition and crossover.

Receiving carriers to account for

Students, teachers, school system, school budget, families

What the original publication measures

Student standardized test outcomes; treatment/class allocation

Unobserved or incompletely observed consequences

Long-term teacher workload, budget consequences, student-by-student counterfactuals and complete family outcomes

Constructive capacity and next experimental search

Compare smaller classes, aides, teacher preparation and targeted support under matched costs; measure students plus teacher time, schools and households.

Strongest comparator

Original Project STAR randomized design; school fixed effects; cost-effectiveness analysis

Current claim status under strict carrier-specific MU+

NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS

Published reference: Krueger 1997, Experimental Estimates of Education Production Functions

https://www.nber.org/papers/w6051

H002 | Oregon Medicaid lottery: insurance and downstream outcomes

Period: 2008–2013 / Field: Healthcare / Study classification: OBSERVED RANDOMIZED INTERVENTION; MIXED OUTCOMES

Historical local goal

Health-insurance enrollment and healthcare access

Published finding / observed consequence

Coverage improved financial protection, preventive services and depression outcomes; measured hypertension, cholesterol and blood sugar showed no statistically significant improvements over about two years.

Receiving carriers to account for

Insured adults, caregivers, clinicians, hospitals, insurers, public budget

What the original publication measures

Depression screens, catastrophic spending, utilization, measured clinical indicators

Unobserved or incompletely observed consequences

Full provider capacity, all taxpayer costs, longer-horizon morbidity, household spillovers

Constructive capacity and next experimental search

Pair insurance access with tested provider-capacity, prevention, and follow-up designs while measuring financial, mental, and physical-health dimensions.

Strongest comparator

Oregon Health Insurance Experiment lottery evaluation

Current claim status under strict carrier-specific MU+

NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS

Published reference: Baicker et al. 2013, New England Journal of Medicine

https://www.nejm.org/doi/full/10.1056/NEJMsa1212321

H003 | Moving to Opportunity: effects depend on age and exposure duration

Period: 1994–2016 / Field: Housing & human development / Study classification: OBSERVED RANDOMIZED PROGRAM; HETEROGENEOUS LONG-TERM OUTCOMES

Historical local goal

Housing vouchers and movement to lower-poverty neighborhoods

Published finding / observed consequence

Children who moved before age 13 later had higher earnings and college attendance; effects of adolescent relocation were slightly negative in the cited analysis.

Receiving carriers to account for

Children, parents, local communities, receiving schools, housing market

What the original publication measures

Long-term tax records, education and earnings; ages at move

Unobserved or incompletely observed consequences

Full social network rupture, displaced-community effects, all fiscal costs, causal decomposition of each service

Constructive capacity and next experimental search

Time relocation and protect continuity of schooling, support networks, transport and family services; compare full multicarrier outcomes.

Strongest comparator

Moving to Opportunity randomized vouchers; age-heterogeneous causal evaluation

Current claim status under strict carrier-specific MU+

NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS

Published reference: Chetty, Hendren & Katz 2016, AER

https://www.aeaweb.org/articles?id=10.1257%2Faer.20150572

H004 | National Supported Work: employment outcomes and distribution

Period: 1970s / Field: Employment / Study classification: PUBLISHED EXPERIMENTAL DATA; LIMITED CARRIER MEASUREMENT

Historical local goal

Employment support for disadvantaged jobseekers

Published finding / observed consequence

The Dehejia-Wahba sample of the NSW program contains treated and controls with subsequent earnings; independent published analysis evaluates earnings effects and how observational methods can mislead.

Receiving carriers to account for

Workers, households, employers, program funders, communities

What the original publication measures

1978 earnings and selected prior employment histories

Unobserved or incompletely observed consequences

Employer productivity, full participant welfare, labor displacement, fiscal costs and future horizons

Constructive capacity and next experimental search

Trace skills-to-work matching and employer demand; combine job placement with barriers to retention, support and cost accounting.

Strongest comparator

Randomized National Supported Work experiment; LaLonde causal inference comparisons

Current claim status under strict carrier-specific MU+

NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS

Published reference: Published historical NSW sample via Rdatasets/causaldata

https://raw.githubusercontent.com/vincentarelbundock/Rdatasets/master/csv/causaldata/nsw_mixtape.csv

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Period: 1960s–2014 / Field: Hydrology & agriculture / Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT

Historical local goal

Agricultural irrigation and cotton production through river diversion

Published finding / observed consequence

Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

Receiving carriers to account for

Farmers, downstream fishing communities, lake ecosystem, regional air and soil, future generations

What the original publication measures

Satellite images, river inflows, fishery records and exposed lakebed

Unobserved or incompletely observed consequences

Counterfactual allocation by season, feasible rights and infrastructure, complete distribution of costs across decades

Constructive capacity and next experimental search

Reallocate flows subject to ecological minima, agricultural productivity, livelihoods, soil and water constraints; model compensation and alternative crop/irrigation systems.

Strongest comparator

Hydrological basin optimization and ecological water-allocation models

Current claim status under strict carrier-specific MU+

CLEARLY NOT A WHOLE-SYSTEM UPTICK UNDER OBSERVED PATH

Published reference: NASA Earth Observatory, World of Change: Aral Sea

https://science.nasa.gov/earth/earth-observatory/world-of-change/aral-sea/

H006 | Bangladesh tube wells: microbial benefit and displaced arsenic exposure

Period: 1970s–2025 / Field: Water & public health / Study classification: OBSERVED RISK SUBSTITUTION; MULTIPLE INDEPENDENT STUDIES

Historical local goal

Replace pathogen-contaminated surface water with groundwater wells

Published finding / observed consequence

Widespread tube well use reduced certain microbial exposures but revealed natural arsenic in many wells; risk evaluations found microbial contamination in some substitute sources.

Receiving carriers to account for

Drinking households, pregnant people and children, water utilities, ecosystems, public budgets

What the original publication measures

Arsenic assays, bacterial contamination, exposure and mortality studies

Unobserved or incompletely observed consequences

Full quality profiles and maintenance outcomes for each alternative, source reliability across seasons, household cost

Constructive capacity and next experimental search

Use spatially shared anonymized well tests, safer deep water where validated, microbial safeguards, upkeep and community transition support.

Strongest comparator

WHO water-safety plans and joint arsenic/microbial DALY risk assessment

Current claim status under strict carrier-specific MU+

NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS

Published reference: Risk Assessment of Arsenic Mitigation Options in Bangladesh

https://pmc.ncbi.nlm.nih.gov/articles/PMC3013255/

H007 | Montreal Protocol: protection capacity through global coordination

Period: 1987–2066 projected / Field: Atmospheric science / Study classification: OBSERVED INTERNATIONAL INTERVENTION; LONG-RUN OUTCOME PROJECTED

Historical local goal

Reduce ozone-depleting substances and repair ozone protection

Published finding / observed consequence

WMO 2022 assessment finds stratospheric ozone recovery progressing; return toward 1980 levels projected on different dates for near-global, Arctic and Antarctic regions.

Receiving carriers to account for

Human populations, ecosystems, industry, consumers, climate system

What the original publication measures

Atmospheric observations, modeled projections of ozone and radiative effects

Unobserved or incompletely observed consequences

Full cross-country distribution of transition costs, replacement chemical side effects, long horizon all-carrier outcomes

Constructive capacity and next experimental search

Evaluate cooling substitutes, Kigali phasedown, affordability, ozone recovery, industrial access and climate together.

Strongest comparator

WMO/UNEP Ozone Scientific Assessment and chemical/climate models

Current claim status under strict carrier-specific MU+

SUBSTANTIAL POSITIVE DOMAIN OUTCOME; STRICT MU+ NOT ESTABLISHED

Published reference: WMO/UNEP Scientific Assessment of Ozone Depletion 2022

https://public.wmo.int/sites/default/files/2023-03/Scientific-Assessment-of-Ozone-Depletion-2022-Executive-Summary.pdf

H008 | Global phaseout of leaded petrol

Period: 1922–2021 / Field: Air pollution & health / Study classification: OBSERVED GLOBAL PHASEOUT; HEALTH BENEFITS MODEL-ESTIMATED

Historical local goal

Improve engine performance using lead additives; later remove lead

Published finding / observed consequence

UNEP reports global cessation of leaded petrol in 2021, with large estimated future health and economic benefits.

Receiving carriers to account for

Children, communities, drivers, fuel producers, environmental reservoirs

What the original publication measures

Policy completion and epidemiological/economic burden estimates

Unobserved or incompletely observed consequences

Full transition cost per country, residual legacy soil burden, remaining lead sources

Constructive capacity and next experimental search

Sustain unleaded fuel and remediate legacy lead in soil and housing, measure child health and equity through time.

Strongest comparator

Public-health burden-of-disease and air-pollution policy evaluation

Current claim status under strict carrier-specific MU+

STRONG HISTORICAL BENEFIT; STRICT MU+ NOT ESTABLISHED

Published reference: UNEP 2021 press release on leaded petrol phaseout

https://www.unep.org/news-and-stories/press-release/era-leaded-petrol-over-eliminating-major-threat-human-and-planetary

H009 | Smallpox eradication: global preventive capacity

Period: 1967–1980 / Field: Global health / Study classification: DOCUMENTED ERADICATION; NOT A FULL ALL-CARRIER STUDY

Historical local goal

Prevent transmission through vaccination and surveillance

Published finding / observed consequence

WHO declared smallpox eradicated in 1980 after international coordinated vaccine access, surveillance and case containment.

Receiving carriers to account for

Potential patients, families, health workers, governments, supply chains

What the original publication measures

Transmission/surveillance records, cases, WHO verification

Unobserved or incompletely observed consequences

All historical vaccine side effects and distributional costs, complete protected carrier set

Constructive capacity and next experimental search

Preserve surveillance and vaccine reserve alongside adverse-event surveillance, equitable access, and institutional readiness.

Strongest comparator

WHO eradication program and infectious-disease epidemiology

Current claim status under strict carrier-specific MU+

DOCUMENTED ERADICATION; STRICT ALL-CARRIER MU+ NOT ESTABLISHED

Published reference: WHO Smallpox facts

https://www.who.int/health-topics/smallpox

H010 | Costa Rica payments for forest conservation: targeting and additionality

Period: 1997–2022 / Field: Ecosystems & economics / Study classification: OBSERVATIONAL POLICY IMPACT EVALUATIONS; MIXED FINDINGS

Historical local goal

Pay forest landowners to conserve ecological services

Published finding / observed consequence

One evaluation did not detect lower deforestation in 1997–2000 paid areas; a 2022 assessment detected a statistically significant first-year effect that was not sustained in subsequent contract years.

Receiving carriers to account for

Landowners, neighboring communities, forest ecosystems, taxpayers, biodiversity

What the original publication measures

Remote sensing, geospatial controls, contract participation and deforestation

Unobserved or incompletely observed consequences

Distribution of payments, biodiversity and social welfare, counterfactual opportunity costs in every locality

Constructive capacity and next experimental search

Target genuinely threatened forest, change contract renewal incentives and monitor biodiversity, livelihood and budget carriers.

Strongest comparator

Difference-in-differences/event-study impacts for conservation payments

Current claim status under strict carrier-specific MU+

MIXED ADDITIONALITY; STRICT MU+ NOT ESTABLISHED

Published reference: Inter-American Development Bank 2022 impact evaluation

https://publications.iadb.org/en/payment-ecosystem-services-costa-rica-evaluation-country-wide-program

H011 | Fukushima disaster response: safety gains and displacement burdens

Period: 2011 onward / Field: Public safety & energy / Study classification: OBSERVED DISASTER AND RESPONSE; COMPLEX COUNTERFACTUAL

Historical local goal

Radiation protection and evacuation after earthquake/tsunami/nuclear accident

Published finding / observed consequence

WHO describes health, social and economic harms associated with evacuation and relocation alongside radiation protection objectives, especially among vulnerable people.

Receiving carriers to account for

Evacuees, older adults, children, healthcare teams, municipalities, environmental systems

What the original publication measures

Radiation doses, public-health surveillance, relocation observations

Unobserved or incompletely observed consequences

Comparable feasible non-evacuation outcomes at individual level, timing and protective resource counterfactuals

Constructive capacity and next experimental search

Integrate dose thresholds with continuity-of-care, transport, shelter, mental-health support and explicit vulnerable-population protection.

Strongest comparator

Radiation emergency protection and disaster-evacuation welfare modelling

Current claim status under strict carrier-specific MU+

PARTIAL PROTECTION WITH DOCUMENTED DISPLACEMENT

Published reference: WHO Fukushima health consequences Q&A

https://www.who.int/news-room/questions-and-answers/item/health-consequences-of-fukushima-nuclear-accident

H012 | Kenya cash transfers: impacts beyond recipients

Period: 2014–2022 / Field: Public finance & human development / Study classification: RANDOMIZED CLUSTER INTERVENTION; SPILLOVERS REPORTED

Historical local goal

Unconditional cash payments to poor households

Published finding / observed consequence

Researchers report positive consumption and assets for recipients, positive spillovers to non-recipients and firms, minimal observed price inflation, and local multipliers in rural Kenya.

Receiving carriers to account for

Recipients, nonrecipients, businesses, caregivers, prices, public/NGO funders

What the original publication measures

Consumption, assets, enterprises, price effects and sampled spillovers

Unobserved or incompletely observed consequences

All external financing opportunity costs, effects beyond local area and measured horizon, unobserved social carriers

Constructive capacity and next experimental search

Integrate cash support with markets, public services and price surveillance while tracking recipients, nonrecipients and fiscal carrier.

Strongest comparator

Cluster-randomized general-equilibrium cash transfer evaluation

Current claim status under strict carrier-specific MU+

POSITIVE OBSERVED SPILLOVERS; STRICT MU+ NOT ESTABLISHED

Published reference: Egger et al. 2022, cash transfer general equilibrium

https://www.nber.org/papers/w26600

H013 | Climate maladaptation: short-term protection and long-term vulnerability

Period: 2022 assessment / Field: Climate governance / Study classification: ASSESSMENT SYNTHESIS; NOT A SINGLE PRIMARY EXPERIMENT

Historical local goal

Flood barriers and defensive infrastructure

Published finding / observed consequence

IPCC identifies short-term actions that can lock in future vulnerability, worsen inequity or increase exposure if not integrated with long-term adaptation planning.

Receiving carriers to account for

Protected property owners, neighboring and downstream communities, ecosystems, future residents

What the original publication measures

Multi-study climate risk evidence and sector assessments

Unobserved or incompletely observed consequences

Specific basin-level causal counterfactual for a given construction and all affected carriers

Constructive capacity and next experimental search

Evaluate adaptive pathways, relocation options, upstream runoff, ecological space and downstream flood routing over long horizons.

Strongest comparator

IPCC AR6 adaptation assessment; regional flood-risk planning

Current claim status under strict carrier-specific MU+

DOCUMENTED RISK OF MALADAPTATION; NO UNIVERSAL PASS

Published reference: IPCC AR6 WGII Summary for Policymakers

https://www.ipcc.ch/report/ar6/wg2/chapter/summary-for-policymakers/

H014 | Bangladesh community deep wells: arsenic reduced, fecal contamination persists

Period: 2021 publication / Field: Water & sanitation / Study classification: RANDOMIZED FIELD INTERVENTION; MIXED OUTCOMES

Historical local goal

Provide community deep tube wells

Published finding / observed consequence

Randomized evaluation found reduced arsenic exposure but did not establish reduced fecal contamination.

Receiving carriers to account for

Drinking households, children, public health, local government

What the original publication measures

Well contamination assays and household source use

Unobserved or incompletely observed consequences

Long-run upkeep, seasonal microbiology and adoption, cost distribution

Constructive capacity and next experimental search

Couple deep well selection with safe sanitation, treatment, maintenance, water-quality verification and household access.

Strongest comparator

Original randomized community deep well evaluation

Current claim status under strict carrier-specific MU+

PARTIAL RISK REDUCTION; STRICT MU+ NOT ESTABLISHED

Published reference: World Bank Economic Review 2021 community wells

https://academic.oup.com/wber/article/35/4/969/6291932

H015 | Thalidomide: symptom relief and unmeasured fetal consequences

Period: 1950s–1962 / Field: Pharmacology & safety / Study classification: DOCUMENTED GLOBAL ADVERSE OUTCOME AND REGULATORY RESPONSE

Historical local goal

Treat insomnia and morning sickness using thalidomide

Published finding / observed consequence

FDA historical records document severe birth defects linked to thalidomide and Frances Kelsey withholding US approval for inadequate safety evidence; new drug-safety rules followed.

Receiving carriers to account for

Pregnant patients, developing fetuses, families, drug manufacturers, regulators

What the original publication measures

Documented congenital harm and regulatory history

Unobserved or incompletely observed consequences

Complete individual exposure counterfactuals and all long-term family welfare

Constructive capacity and next experimental search

Pre-release developmental toxicity testing, stronger adverse-event surveillance, transparency, pregnancy protection and safer alternatives.

Strongest comparator

Regulatory pharmacovigilance, reproductive toxicology and risk-benefit analysis

Current claim status under strict carrier-specific MU+

OBSERVED CATASTROPHIC CONSEQUENCES; NO STRICT MU+

Published reference: FDA history: Frances Kelsey, Thalidomide and global harm

https://www.fda.gov/about-fda/fda-history-exhibits/brief-history-center-drug-evaluation-and-research

H016 | Loophole-free Bell test: physical correlations at microscopic scale

Period: 2015 / Field: Quantum experimental physics / Study classification: PUBLISHED CONTROLLED QUANTUM EXPERIMENT; NOT A WELFARE INTERVENTION

Historical local goal

Distinguish local-realist predictions from quantum theory with controlled entangled electron spins

Published finding / observed consequence

The 2015 Bell test used distant electron spins and obtained CHSH S=2.42 +/- 0.20 in 245 trials, inconsistent with a local-realist null at its specified statistical level.

Receiving carriers to account for

Electron-spin degrees of freedom, measurement devices, detector and noise process, experimenters

What the original publication measures

Trial detection outcomes, measurement settings and correlations

Unobserved or incompletely observed consequences

No normative or material protected-carrier welfare outcome; quantum results do not establish cross-substrate consciousness or a universal MU+ mechanism

Constructive capacity and next experimental search

For physical claims, specify K_R predictions about experimental quantum observables that differ from standard quantum theory and test them with independent datasets.

Strongest comparator

Bell inequality and quantum measurement theory, experimental controls and null models

Current claim status under strict carrier-specific MU+

REAL PHYSICS TEST, NOT A MUTUAL UPTICK ACCEPTANCE TEST

Published reference: Hensen et al. 2015, Nature, loophole-free Bell inequality violation

https://www.nature.com/articles/nature15759

H017 | Gene-edited sickle cell therapy: biological repair and receiving-care infrastructure

Period: 2023 onward / Field: Genomic medicine / Study classification: REGULATORY APPROVAL WITH CLINICAL TRIAL EVIDENCE; ACCESS EFFECTS OPEN

Historical local goal

Treat sickle cell disease using autologous cell therapies

Published finding / observed consequence

FDA approved the first cell-based gene therapies for sickle cell disease in December 2023, including the first therapy using CRISPR editing; approval reflects assessed clinical evidence, not universal access.

Receiving carriers to account for

Patients, stem cells, healthcare teams, payers, families, care delivery network

What the original publication measures

Regulatory benefit-risk records and treatment eligibility

Unobserved or incompletely observed consequences

Worldwide affordability, preparatory treatment risks, lifelong surveillance, displaced healthcare resources, access equity

Constructive capacity and next experimental search

Study clinical outcomes jointly with transplant capacity, monitoring, affordability, family support and access equity, not genetic correction alone.

Strongest comparator

FDA regulated clinical trials and health-technology assessment

Current claim status under strict carrier-specific MU+

REGULATORY CLINICAL MILESTONE; STRICT MU+ NOT ESTABLISHED

Published reference: FDA 2023 approval of sickle-cell gene therapies

https://www.fda.gov/news-events/press-announcements/fda-approves-first-gene-therapies-treat-patients-sickle-cell-disease

H018 | LIGO gravitational wave detection: new observational infrastructure

Period: 2015–2016 / Field: Gravitational physics / Study classification: OBSERVED PHYSICAL MEASUREMENT; NOT A WELFARE INTERVENTION

Historical local goal

Construct interferometers capable of detecting gravitational waves

Published finding / observed consequence

The upgraded LIGO interferometers performed an observation run beginning September 2015, detecting astrophysical gravitational-wave signals; this tests general relativity in a domain inaccessible to unaided human senses.

Receiving carriers to account for

Gravitational-wave sources, optical and mechanical sensors, detection infrastructure, scientific community

What the original publication measures

Detector strain signals and physical model fits

Unobserved or incompletely observed consequences

No native per-carrier positive welfare metric; this is a scientific observation not a strict Mutual Uptick implementation

Constructive capacity and next experimental search

For K_R as physical law, derive a unique testable observable for interferometer systems and compare blinded predictions to general relativity under matched data.

Strongest comparator

General relativity waveform models and interferometric detector calibration

Current claim status under strict carrier-specific MU+

REAL PHYSICS EVIDENCE; NO K_R MECHANISM TEST

Published reference: LIGO Collaboration 2016, Advanced LIGO detectors in first discovery run

https://doi.org/10.1103/PhysRevLett.116.131103

PART II · 120 DOMAIN WORKPACKS

Source-authenticated native mappings, causal requirements and the continuing construction search

ADAPTER 001 · Whole-person quality of life

Family: Human life quality | Atlas pages: 51–57 | Original status: Constructive protocol

Evidence-grounded native state

Health, function, time, autonomy, relationships, safety, income, environment and future capacity

Receiving schema and recognition gap

Single score, diagnosis, income bracket or productivity proxy

Candidate blocker

Improvement in one life dimension paid for by another

Named receiving carriers

Person, household, caregivers, future self

Constructive receiving capacity proposed in Atlas

Whole-life state model plus coordinated capacity across health, time, income and environment

Author-defined Mutual Uptick acceptance target

Health, autonomy, security, time and relational capacity all improve without hidden depletion

Decisive experiment described in Atlas

Longitudinal cohort with preregistered multidimensional outcomes

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 001 · Whole-person quality of life | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Health, function, time, autonomy, relationships, safety, income, environment and future capacity. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Person, household, caregivers, future self. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Single score, diagnosis, income bracket or productivity proxy. Then test the specific candidate blocker: Improvement in one life dimension paid for by another. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Whole-life state model plus coordinated capacity across health, time, income and environment. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003, H012. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Health, autonomy, security, time and relational capacity all improve without hidden depletion. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Longitudinal cohort with preregistered multidimensional outcomes. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 002 · Nutrition and metabolism

Family: Human life quality | Atlas pages: 58–64 | Original status: Regulated empirical frontier

Evidence-grounded native state

Diet, metabolic state, affordability, culture, timing, microbiome and activity

Receiving schema and recognition gap

Calories/macros or generic diet categories

Candidate blocker

Biological benefit shifts cost to adherence, affordability or another metabolic pathway

Named receiving carriers

Body, household budget, food system

Constructive receiving capacity proposed in Atlas

Adaptive nutrition and access architecture with feedback and affordability constraints

Author-defined Mutual Uptick acceptance target

Metabolic markers, adherence, affordability and quality of life improve together

Decisive experiment described in Atlas

Randomized adaptive nutrition trial with cost and adherence carriers

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 002 · Nutrition and metabolism | IMPLEMENTATION SPECIFICATION

Construction search

Candidate structure to investigate: Adaptive nutrition and access architecture with feedback and affordability constraints. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H008. Direct linkage by documented application theme.

Acceptance, verification and recurrence

Intended measurable outcome: Metabolic markers, adherence, affordability and quality of life improve together. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Randomized adaptive nutrition trial with cost and adherence carriers. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 003 · Sleep and recovery

Family: Human life quality | Atlas pages: 65–71 | Original status: Constructive protocol

Evidence-grounded native state

Sleep architecture, circadian timing, stress, workload, environment and recovery reserve

Receiving schema and recognition gap

Hours slept or wearable score

Candidate blocker

More sleep opportunity can displace work, care or circadian alignment

Named receiving carriers

Body, cognition, household schedule

Constructive receiving capacity proposed in Atlas

Recovery controller integrating timing, environment, workload and physiology

Author-defined Mutual Uptick acceptance target

Recovery, cognition, safety and schedule burden improve together

Decisive experiment described in Atlas

Longitudinal crossover study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 003 · Sleep and recovery | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Sleep architecture, circadian timing, stress, workload, environment and recovery reserve. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Body, cognition, household schedule. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Hours slept or wearable score. Then test the specific candidate blocker: More sleep opportunity can displace work, care or circadian alignment. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Recovery controller integrating timing, environment, workload and physiology. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003, H012. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Recovery, cognition, safety and schedule burden improve together. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Longitudinal crossover study. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 004 · Reproductive and sexual health

Family: Human life quality | Atlas pages: 72–78 | Original status: Regulated empirical frontier

Evidence-grounded native state

Endocrine, reproductive, sexual, relational, consent, fertility and safety state

Receiving schema and recognition gap

Single fertility, disease or risk label

Candidate blocker

Local treatment shifts hormonal, relational, financial or future burden

Named receiving carriers

Individual, partner, future child, household

Constructive receiving capacity proposed in Atlas

Longitudinal reproductive-state architecture plus consent/safety controls

Author-defined Mutual Uptick acceptance target

Health, autonomy, safety and desired reproductive outcomes improve

Decisive experiment described in Atlas

Clinical trials + patient-reported and partner- impact carriers

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 004 · Reproductive and sexual health | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Endocrine, reproductive, sexual, relational, consent, fertility and safety state. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Individual, partner, future child, household. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Single fertility, disease or risk label. Then test the specific candidate blocker: Local treatment shifts hormonal, relational, financial or future burden. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Longitudinal reproductive-state architecture plus consent/safety controls. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H015. Direct linkage by documented application theme.

Acceptance, verification and recurrence

Intended measurable outcome: Health, autonomy, safety and desired reproductive outcomes improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Clinical trials + patient-reported and partner- impact carriers. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 005 · Disability and accessibility

Family: Human life quality | Atlas pages: 79–85 | Original status: Strong constructive fit

Evidence-grounded native state

Capabilities plus environmental demands, interfaces and support

Receiving schema and recognition gap

Deficit-only person label

Candidate blocker

Person compensates for inaccessible environment

Named receiving carriers

Person, caregiver, workplace, public space

Constructive receiving capacity proposed in Atlas

Environment-first accessibility architecture plus assistive capacity

Author-defined Mutual Uptick acceptance target

Capability, independence and participation rise while compensatory load falls

Decisive experiment described in Atlas

Before/after environment redesign with workload measures

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 005 · Disability and accessibility | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Capabilities plus environmental demands, interfaces and support. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Person, caregiver, workplace, public space. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Deficit-only person label. Then test the specific candidate blocker: Person compensates for inaccessible environment. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Environment-first accessibility architecture plus assistive capacity. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003, H012. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Capability, independence and participation rise while compensatory load falls. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Before/after environment redesign with workload measures. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 006 · Mobility and physical function

Family: Human life quality | Atlas pages: 86–92 | Original status: Regulated empirical frontier

Evidence-grounded native state

Strength, pain, balance, endurance, environment, assistive devices

Receiving schema and recognition gap

Single functional score

Candidate blocker

Function gains can increase pain, fatigue or caregiver burden

Named receiving carriers

Body, caregiver, environment

Constructive receiving capacity proposed in Atlas

Adaptive rehabilitation plus environment and device redesign

Author-defined Mutual Uptick acceptance target

Function, comfort, autonomy and caregiver load improve

Decisive experiment described in Atlas

Controlled rehabilitation study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 006 · Mobility and physical function | IMPLEMENTATION SPECIFICATION

ADAPTER 007 · Family and caregiving

Family: Human life quality | Atlas pages: 93–99 | Original status: Strong structural fit

Evidence-grounded native state

Needs, capacities, schedules, money, emotional load, dependency and support network

Receiving schema and recognition gap

Household role labels

Candidate blocker

One caregiver silently absorbs system failure

Named receiving carriers

Primary caregiver, dependents, siblings, employer

Constructive receiving capacity proposed in Atlas

Care-load ledger, shared coordination and external capacity

Author-defined Mutual Uptick acceptance target

Dependent wellbeing and caregiver wellbeing both improve

Decisive experiment described in Atlas

Prospective household burden study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 007 · Family and caregiving | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical case pointers

Related evidence records: H003, H012. Direct linkage by documented application theme.

Acceptance, verification and recurrence

Intended measurable outcome: Dependent wellbeing and caregiver wellbeing both improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Prospective household burden study. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 008 · Safety and personal security

Family: Human life quality | Atlas pages: 100–106 | Original status: Constructive protocol

Evidence-grounded native state

Threat exposure, environment, support, mobility and response capacity

Receiving schema and recognition gap

Incident count or generic risk class

Candidate blocker

Protection shifts restriction or surveillance burden onto protected person

Named receiving carriers

Person, community, responder

Constructive receiving capacity proposed in Atlas

Safety architecture that increases protection without reducing autonomy

Author-defined Mutual Uptick acceptance target

Threat falls while freedom, privacy and response burden improve

Decisive experiment described in Atlas

Prospective safety intervention

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 008 · Safety and personal security | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Research design: Prospective safety intervention. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 009 · Housing and domestic environment

Family: Human life quality | Atlas pages: 107–113 | Original status: Strong structural fit

Evidence-grounded native state

Shelter, cost, commute, safety, air, heat, crowding and social context

Receiving schema and recognition gap

Property price or occupancy status

Candidate blocker

Affordability, commute, health and neighborhood burdens trade places

Named receiving carriers

Resident, landlord, neighborhood, city

Constructive receiving capacity proposed in Atlas

Whole-cost housing and location architecture

Author-defined Mutual Uptick acceptance target

Housing quality, affordability, access and neighborhood outcomes improve

Decisive experiment described in Atlas

Matched housing intervention

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 009 · Housing and domestic environment | IMPLEMENTATION SPECIFICATION

ADAPTER 010 · Human longevity and life-course planning

Family: Human life quality | Atlas pages: 114–120 | Original status: Constructive protocol

Evidence-grounded native state

Healthspan, lifespan, finances, relationships, purpose and care capacity

Receiving schema and recognition gap

Chronological age or retirement age

Candidate blocker

Longer life shifts burden to morbidity, savings or care system

Named receiving carriers

Person, family, institutions, future self

Constructive receiving capacity proposed in Atlas

Life-course capital and care architecture

Author-defined Mutual Uptick acceptance target

Added years are healthy, funded, connected and autonomous

Decisive experiment described in Atlas

Longitudinal life-course cohort

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 010 · Human longevity and life-course planning | IMPLEMENTATION SPECIFICATION

Receiving carrier ledger

Open an auditable ledger for: Individual, family, community. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Institutional affiliation alone. Then test the specific candidate blocker: Community benefit can shift burden to autonomy or dissent. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Voluntary, transparent, safeguarding-centered spiritual/community architecture. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003, H011. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Meaning and belonging improve without coercion or exclusion. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Ethical observational study. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 018 · Religion and community institutions

Family: Psychology and meaning | Atlas pages: 171–177 | Original status: Constructive protocol

Evidence-grounded native state

Doctrine, governance, resources, safeguarding and member experience

Receiving schema and recognition gap

Membership or doctrinal category

Candidate blocker

Institutional continuity can externalize harm or dissent costs

Named receiving carriers

Members, families, leaders, wider community

Constructive receiving capacity proposed in Atlas

Transparent governance, reporting, safeguarding and exit rights

Author-defined Mutual Uptick acceptance target

Community value rises while coercion and hidden harm fall

Decisive experiment described in Atlas

Institutional longitudinal audit

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 018 · Religion and community institutions | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Doctrine, governance, resources, safeguarding and member experience. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Members, families, leaders, wider community. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Membership or doctrinal category. Then test the specific candidate blocker: Institutional continuity can externalize harm or dissent costs. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Transparent governance, reporting, safeguarding and exit rights. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003, H011. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Community value rises while coercion and hidden harm fall. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Institutional longitudinal audit. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 019 · Emotion and affect regulation

Family: Psychology and meaning | Atlas pages: 178–184 | Original status: Constructive protocol

Evidence-grounded native state

Internal state, context, physiology, cognition and social feedback

Receiving schema and recognition gap

Valence score or symptom label

Candidate blocker

Suppression improves appearance while physiological load rises

Named receiving carriers

Person and relationships

Constructive receiving capacity proposed in Atlas

State-aware regulation architecture with physiological feedback

Author-defined Mutual Uptick acceptance target

Emotional flexibility and physiological stability improve

Decisive experiment described in Atlas

Crossover intervention study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 019 · Emotion and affect regulation | IMPLEMENTATION SPECIFICATION

ADAPTER 032 · K-12 education | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Knowledge, skills, wellbeing, context, resources and learning trajectory. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Student, teacher, family. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Grade/test score. Then test the specific candidate blocker: Score gains shift burden to stress, teaching-to-test or exclusion. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Capability graph + adaptive learning + wellbeing constraints. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H001, H003. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Learning, wellbeing, teacher load and equity improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Cluster randomized trial. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 033 · Higher education

Family: Education, justice and governance | Atlas pages: 278–284 | Original status: Constructive protocol

Evidence-grounded native state

Capability, knowledge, network, finances and career pathways

Receiving schema and recognition gap

Degree/GPA credential

Candidate blocker

Credential value shifts debt or mismatch to student/employer

Named receiving carriers

Student, family, employer

Constructive receiving capacity proposed in Atlas

Capability/provenance portfolio + adaptive pathways

Author-defined Mutual Uptick acceptance target

Learning, employability, affordability and wellbeing improve

Decisive experiment described in Atlas

Longitudinal graduate outcomes

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Related evidence records: H010. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Creator income, access, provenance and cultural stewardship improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Marketplace field study. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 047 · Music and entertainment

Family: Culture, beauty and experience | Atlas pages: 377–383 | Original status: Constructive protocol

Evidence-grounded native state

Creative contribution, rights, attention, audience value and platform economics

Receiving schema and recognition gap

Stream/view count

Candidate blocker

Engagement gain shifts creator income or audience wellbeing

Named receiving carriers

Creators, audiences, platforms

Constructive receiving capacity proposed in Atlas

Contribution/provenance + value-distribution architecture

Author-defined Mutual Uptick acceptance target

Creator value and audience experience improve without exploitative load

Decisive experiment described in Atlas

Platform experiment

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 047 · Music and entertainment | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Creative contribution, rights, attention, audience value and platform economics. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Creators, audiences, platforms. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Stream/view count. Then test the specific candidate blocker: Engagement gain shifts creator income or audience wellbeing. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Contribution/provenance + value-distribution architecture. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H010. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Creator value and audience experience improve without exploitative load. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Platform experiment. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 048 · Gaming and virtual worlds

Family: Culture, beauty and experience | Atlas pages: 384–390 | Original status: Constructive protocol

Evidence-grounded native state

Player goals, time, identity, economy, safety and creator contribution

Receiving schema and recognition gap

Retention/spend metric

Candidate blocker

Revenue shifts time, financial or social burden to players

Named receiving carriers

Players, creators, communities

Constructive receiving capacity proposed in Atlas

Cross-reality value and safety controller

Author-defined Mutual Uptick acceptance target

Fun, agency, creator value and safety improve

Decisive experiment described in Atlas

Platform experiment

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 048 · Gaming and virtual worlds | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Model state, source reality, user intent, provenance, uncertainty and downstream action. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: User, verifier, downstream system, compute. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Prompt/context window/model output. Then test the specific candidate blocker: Model utility shifts verification and error burden to humans. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Persistent schema/provenance layer + self-audit and escalation. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H008. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Utility, correctness, verification load and resource efficiency improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Sealed cross-model benchmark. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 062 · Software systems

Family: Technology and information | Atlas pages: 484–490 | Original status: Strong structural fit

Evidence-grounded native state

Requirements, dependencies, state, users, infrastructure and technical debt

Receiving schema and recognition gap

Feature/ticket/local module schema

Candidate blocker

Feature success shifts debt or failure to dependencies

Named receiving carriers

Developers, users, infrastructure

Constructive receiving capacity proposed in Atlas

Dependency/provenance graph + consequential release controller

Author-defined Mutual Uptick acceptance target

User value, reliability, maintainability and developer load improve

Decisive experiment described in Atlas

Repository-level prospective benchmark

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 062 · Software systems | IMPLEMENTATION SPECIFICATION

Disposal removes item from local ledger but not system

Named receiving carriers

Communities, environment, future production

Constructive receiving capacity proposed in Atlas

Material provenance + recapture + transformation capacity

Author-defined Mutual Uptick acceptance target

Waste, cost and virgin input demand fall while value recovery rises

Decisive experiment described in Atlas

Municipal/industrial pilot

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 076 · Waste and circular materials | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Material composition, location, contamination, residual value and logistics. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Communities, environment, future production. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Waste tonnage/disposal category. Then test the specific candidate blocker: Disposal removes item from local ledger but not system. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Material provenance + recapture + transformation capacity. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H007, H008. Direct linkage by documented application theme.

Acceptance, verification and recurrence

Intended measurable outcome: Waste, cost and virgin input demand fall while value recovery rises. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Municipal/industrial pilot. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 077 · Transportation and mobility

Family: Earth, infrastructure and ecology | Atlas pages: 590–596 | Original status: Constructive protocol

Evidence-grounded native state

Trips, time, safety, access, energy, congestion and land use

Receiving schema and recognition gap

Vehicle throughput/speed

Candidate blocker

Faster local travel creates congestion, emissions or exclusion

Named receiving carriers

Travelers, neighborhoods, environment

Constructive receiving capacity proposed in Atlas

Multimodal consequential mobility controller

Author-defined Mutual Uptick acceptance target

Access, time, safety, energy and neighborhood outcomes improve

Decisive experiment described in Atlas

City corridor pilot

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 077 · Transportation and mobility | IMPLEMENTATION SPECIFICATION

Research design: City corridor pilot. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 078 · Cities and urban systems

Family: Earth, infrastructure and ecology | Atlas pages: 597–603 | Original status: Constructive protocol

Evidence-grounded native state

Housing, jobs, transport, health, utilities, safety and public space

Receiving schema and recognition gap

Agency-by-agency city data

Candidate blocker

One department shifts burden to another neighborhood/system

Named receiving carriers

Residents, agencies, infrastructure

Constructive receiving capacity proposed in Atlas

City consequential digital twin + coordinated capacity

Author-defined Mutual Uptick acceptance target

Access, health, resilience, affordability and service improve

Decisive experiment described in Atlas

District pilot

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Intended measurable outcome: Fidelity rises while ambiguity and proof/representation cost fall. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Machine-checked theorem suite. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 091 · Statistics and causal inference

Family: Frontier, illicit and cosmic | Atlas pages: 690–696 | Original status: Strong structural fit

Evidence-grounded native state

Data-generating process, sampling, measurement, confounding and uncertainty

Receiving schema and recognition gap

Chosen model/estimand

Candidate blocker

Local fit hides transportability or selection bias

Named receiving carriers

Decision makers, future samples, affected groups

Constructive receiving capacity proposed in Atlas

Provenance-aware multi-model causal state + identifiability guardrails

Author-defined Mutual Uptick acceptance target

Predictive/causal validity improves without hidden subgroup harm

Decisive experiment described in Atlas

Simulation + multi-dataset benchmark

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 091 · Statistics and causal inference | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Data-generating process, sampling, measurement, confounding and uncertainty. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Decision makers, future samples, affected groups. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Chosen model/estimand. Then test the specific candidate blocker: Local fit hides transportability or selection bias. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Provenance-aware multi-model causal state + identifiability guardrails. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H016. Direct linkage by documented application theme.

Acceptance, verification and recurrence

Intended measurable outcome: Predictive/causal validity improves without hidden subgroup harm. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Simulation + multi-dataset benchmark. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 092 · Logic and reasoning systems

Family: Frontier, illicit and cosmic | Atlas pages: 697–703 | Original status: Formal frontier

Evidence-grounded native state

Premises, inference rules, contradictions, uncertainty and goals

Receiving schema and recognition gap

Single logical calculus

Candidate blocker

Consistency in one calculus loses expressivity/context elsewhere

Named receiving carriers

Reasoner, downstream decision

Constructive receiving capacity proposed in Atlas

Multi-logic translation + contradiction provenance

Author-defined Mutual Uptick acceptance target

Validity, expressivity and computational tractability improve

Decisive experiment described in Atlas

Formal benchmark

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 092 · Logic and reasoning systems | IMPLEMENTATION SPECIFICATION

Evaluate the incumbent representation: Single logical calculus. Then test the specific candidate blocker: Consistency in one calculus loses expressivity/context elsewhere. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Multi-logic translation + contradiction provenance. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H005, H009. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Validity, expressivity and computational tractability improve. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Formal benchmark. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 093 · Geography and territorial systems

Family: Frontier, illicit and cosmic | Atlas pages: 704–710 | Original status: Constructive protocol

Evidence-grounded native state

People, ecosystems, infrastructure, flows and administrative boundaries

Receiving schema and recognition gap

Jurisdiction/map boundary

Candidate blocker

Administrative optimization ignores cross-border flows

Named receiving carriers

Border communities, watersheds, networks

Constructive receiving capacity proposed in Atlas

Flow-based territorial state model

Author-defined Mutual Uptick acceptance target

Access, resilience and cross-boundary fairness improve

Decisive experiment described in Atlas

Regional pilot

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 095 · Illicit and black markets

Family: Frontier, illicit and cosmic | Atlas pages: 718–724 | Original status: Safety-governed frontier

Evidence-grounded native state

Hidden demand, supply, coercion, enforcement, prices and harm

Receiving schema and recognition gap

Official market data that excludes hidden exchange

Candidate blocker

Profit and access externalize violence, exploitation or public harm

Named receiving carriers

Victims, communities, lawful firms, institutions

Constructive receiving capacity proposed in Atlas

Lawful substitutes, prevention, provenance, treatment/rehabilitation and targeted enforcement

Author-defined Mutual Uptick acceptance target

Harm and illicit profitability fall while legitimate access/opportunity rises

Decisive experiment described in Atlas

Independent harm-reduction/public-safety evaluation

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Acceptance, verification and recurrence

Intended measurable outcome: Legibility, agency and viable functioning increase without reducing an unmodeled carrier to zero. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Prospective multi-method cross-observer study. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 102 · Choice and option topology

Family: Conscious agency and responsibility | Atlas pages: 768–774 | Original status: Constructive protocol

Evidence-grounded native state

Actual options, perceived options, cost, risk, time, capacity, knowledge, coercion and expected consequence

Receiving schema and recognition gap

Binary free-choice / no-choice label

Candidate blocker

Nominal alternatives exist while executable humane alternatives are absent or prohibitively costly

Named receiving carriers

Chooser, affected people, institutions and future option set

Constructive receiving capacity proposed in Atlas

Feasible-option map plus prebuilt low-friction lawful/prosocial pathways

Author-defined Mutual Uptick acceptance target

Agency expands while downstream harm and coercive friction fall

Decisive experiment described in Atlas

Prospective choice-topology intervention

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Field protocol and responsibility

Research design: Prospective choice-topology intervention. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 103 · Truth, deception and disclosure

Family: Conscious agency and responsibility | Atlas pages: 775–781 | Original status: Constructive protocol

Evidence-grounded native state

Belief, evidence, incentives, threat, reputation, disclosure cost, dependency and repair capacity

Receiving schema and recognition gap

Truth/lie binary detached from consequence topology

Candidate blocker

Truth creates concentrated cost or deception remains locally profitable because receiving capacity is absent

Named receiving carriers

Speaker, listener, harmed parties, institutions and future trust network

Constructive receiving capacity proposed in Atlas

Verification, safe disclosure, correction, restitution and transition capacity

Author-defined Mutual Uptick acceptance target

Fidelity rises while truthful disclosure no longer requires avoidable destruction of material carriers

Decisive experiment described in Atlas

Sealed truth-cost / disclosure study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Related evidence records: H003. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Attribution, safety, restitution and future agency improve without hiding causal contribution. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Blinded case reconstruction with preregistered causal criteria. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 105 · Consent, coercion and autonomy

Family: Conscious agency and responsibility | Atlas pages: 789–795 | Original status: High-stakes protocol

Evidence-grounded native state

Information, power, alternatives, dependency, exit, reversibility, time pressure and capacity

Receiving schema and recognition gap

Signed/expressed consent treated as sufficient state

Candidate blocker

Apparent agreement is purchased by narrowed alternatives or irreversible dependency

Named receiving carriers

Decision maker, counterparties, dependents and future self

Constructive receiving capacity proposed in Atlas

Real exit, recourse, reversible consent, information symmetry and alternative capacity

Author-defined Mutual Uptick acceptance target

Agreement quality and autonomy rise together while coercive burden falls

Decisive experiment described in Atlas

Prospective consent-quality audit

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 105 · Consent, coercion and autonomy | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Information, power, alternatives, dependency, exit, reversibility, time pressure and capacity. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Decision maker, counterparties, dependents and future self. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Signed/expressed consent treated as sufficient state. Then test the specific candidate blocker: Apparent agreement is purchased by narrowed alternatives or irreversible dependency. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Real exit, recourse, reversible consent, information symmetry and alternative capacity. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H003. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Agreement quality and autonomy rise together while coercive burden falls. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Prospective consent-quality audit. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 106 · Addiction, compulsion and short-horizon relief

Family: Conscious agency and responsibility | Atlas pages: 796–802 | Original status: Regulated empirical frontier

Evidence-grounded native state

Distress, reward, relief, dependence, physiology, social setting, opportunity and future option set

Receiving schema and recognition gap

Substance/behavior category or abstinence binary

Candidate blocker

A behavior successfully absorbs immediate burden while narrowing future agency and exporting cost

Named receiving carriers

Person, body, relationships, household, community and future self

Constructive receiving capacity proposed in Atlas

Replacement regulation capacity plus medical/social/economic support matched to the absorbed burden

Author-defined Mutual Uptick acceptance target

Relief, agency, health and social function improve while dependency burden falls

Decisive experiment described in Atlas

Longitudinal regulated intervention with multi-carrier outcomes

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 106 · Addiction, compulsion and short-horizon relief | IMPLEMENTATION SPECIFICATION

Research design: Longitudinal regulated intervention with multi-carrier outcomes. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 107 · Crime, violence and reconciliation

Family: Conscious agency and responsibility | Atlas pages: 803–809 | Original status: High-stakes protocol

Evidence-grounded native state

Actor state, victim state, opportunity, motives, option topology, weapons/access, social environment and foreseeable harm

Receiving schema and recognition gap

Offense label or actor-only risk score

Candidate blocker

Prevention, punishment or rehabilitation optimizes one carrier while exporting burden to victims, families or future safety

Named receiving carriers

Victims, actor, families, community, institutions and future potential victims

Constructive receiving capacity proposed in Atlas

Prevention, containment where needed, restitution, rehabilitation and reintegration capacity in one ledger

Author-defined Mutual Uptick acceptance target

Victim safety, accountability, recurrence, repair and future lawful agency improve together

Decisive experiment described in Atlas

Longitudinal controlled justice-program evaluation

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 108 · Animal sentience and welfare

Family: Conscious agency and responsibility | Atlas pages: 810–816 | Original status: Ethical / empirical frontier

Evidence-grounded native state

Physiology, behavior, social state, environment, pain/pleasure proxies, health and life trajectory

Receiving schema and recognition gap

Commodity/yield schema that excludes the animal as a carrier

Candidate blocker

Human nutrition or commercial gain is produced by unrepresented animal or ecological burden

Named receiving carriers

Animals, workers, consumers, farmers, land, ecosystems and communities

Constructive receiving capacity proposed in Atlas

Welfare, alternative-production, livelihood-transition and ecological capacity

Author-defined Mutual Uptick acceptance target

Nutrition and livelihoods improve while animal and ecological burden also improves or is materially reduced

Decisive experiment described in Atlas

Multi-carrier welfare, nutrition and livelihood trial

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 108 · Animal sentience and welfare | IMPLEMENTATION SPECIFICATION

Research design: Multi-carrier welfare, nutrition and livelihood trial. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 109 · Collective agency and institutional choice

Family: Conscious agency and responsibility | Atlas pages: 817–823 | Original status: Constructive protocol

Evidence-grounded native state

Shared beliefs, rules, authority, voting, incentives, information, dissent, enforcement and institutional memory

Receiving schema and recognition gap

Organization treated as a single actor without internal carrier structure

Candidate blocker

Collective decisions hide minority burdens or diffuse accountability until no node owns the consequence

Named receiving carriers

Members, minorities, leaders, outsiders, institutions and future administrations

Constructive receiving capacity proposed in Atlas

Distributed decision provenance, dissent channels, accountability and cross-boundary capacity

Author-defined Mutual Uptick acceptance target

Collective performance and legitimacy rise without burden concentration or responsibility diffusion

Decisive experiment described in Atlas

Prospective institutional decision audit

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Field protocol and responsibility

Research design: Prospective institutional decision audit. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 110 · Human-AI co-agency

Family: Conscious agency and responsibility | Atlas pages: 824–830 | Original status: Strong constructive fit

Evidence-grounded native state

Human intent, model state, training/provenance, tools, permissions, action, reversibility, dependency and downstream effects

Receiving schema and recognition gap

Model output or benchmark score treated as the whole system

Candidate blocker

Capability gain shifts verification, dependency, control or error burden onto humans and downstream systems

Named receiving carriers

User, non-user, model operator, workers, institutions, infrastructure and environment

Constructive receiving capacity proposed in Atlas

Persistent provenance, human control, reversibility, portability, verification and receivingcapacity layers

Author-defined Mutual Uptick acceptance target

Capability rises while human agency, correctness, reversibility and surrounding-system viability also improve

Decisive experiment described in Atlas

Sealed native-vs-K_R assisted agent benchmark

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 111 · Evolution and natural selection

Family: Evolution, transformation and emergence | Atlas pages: 832–838 | Original status: Hard scientific translation frontier

Evidence-grounded native state

Genotype, phenotype, environment, mutation, recombination, drift, selection, gene flow and lineage history

Receiving schema and recognition gap

Fitness proxy or single-trait narrative

Candidate blocker

Local adaptation increases one lineage/trait while hidden ecological or long-horizon costs move elsewhere

Named receiving carriers

Individuals, lineages, populations, interacting species and ecosystems

Constructive receiving capacity proposed in Atlas

Diversity, ecological capacity and intervention guardrails where deliberate action exists

Author-defined Mutual Uptick acceptance target

Persistence/adaptation improves without avoidable collapse in materially coupled populations or ecosystems

Decisive experiment described in Atlas

Time-locked population/genomic holdout

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 112 · Reproduction, inheritance, mitosis and meiosis

Family: Evolution, transformation and emergence | Atlas pages: 839–845 | Original status: Strong structural translation

Evidence-grounded native state

Chromosomes, cell-cycle state, replication, recombination, segregation, repair and developmental context

Receiving schema and recognition gap

Outcome-only birth/division count

Candidate blocker

Propagation success hides fidelity loss, developmental burden or downstream instability

Named receiving carriers

Parent cell/organism, daughter cells, gametes, offspring and lineage

Constructive receiving capacity proposed in Atlas

Checkpoint, repair, redundancy and developmental-support capacity

Author-defined Mutual Uptick acceptance target

Propagation remains viable while fidelity, diversity and downstream function stay within safe bounds

Decisive experiment described in Atlas

Lineage-resolved perturbation study

Status boundary

ADAPTER 113 · Development and morphogenesis

Family: Evolution, transformation and emergence | Atlas pages: 846–852 | Original status: Regulated empirical frontier

Evidence-grounded native state

Gene regulation, gradients, cell fate, tissue geometry, signaling, mechanics, resources and developmental time

Receiving schema and recognition gap

Single marker or endpoint morphology

Candidate blocker

Correcting one developmental feature displaces stress into another tissue, stage or regulatory pathway

Named receiving carriers

Cells, tissues, organs, organism and developmental future state

Constructive receiving capacity proposed in Atlas

Stage-aware multi-pathway support, repair and resource architecture

Author-defined Mutual Uptick acceptance target

Functional development improves without compensatory developmental injury

Decisive experiment described in Atlas

Longitudinal developmental perturbation study

Status boundary

ADAPTER 114 · Metabolism, diet and consumption

Family: Evolution, transformation and emergence | Atlas pages: 853–859 | Original status: Strong structural fit

Evidence-grounded native state

Incoming matter/energy/information, digestion, transport, microbiome, storage, elimination and metabolic regulation

Receiving schema and recognition gap

Calories/macros or one nutrient target

Candidate blocker

Useful intake is achieved by shifting toxicity, deficiency, cost or metabolic burden elsewhere

Named receiving carriers

Gut, microbiome, liver, tissues, household, food system and future organism

Constructive receiving capacity proposed in Atlas

Adaptive conversion, buffering, storage, elimination and access capacity

Author-defined Mutual Uptick acceptance target

Useful incorporation, metabolic stability, affordability and quality of life improve together

Decisive experiment described in Atlas

Controlled longitudinal multi-carrier nutrition study

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 115 · Predation, livestock and food-system transformation

Family: Evolution, transformation and emergence | Atlas pages: 860–866 | Original status: Ethical / ecological frontier

Evidence-grounded native state

Predator-prey relations, husbandry, feed, land, labor, animal state, nutrition, culture, price and ecology

Receiving schema and recognition gap

Yield, price or human nutrition alone

Candidate blocker

One species/system survives or profits by exporting unrepresented burden into another conscious/ecological carrier

Named receiving carriers

Animals, humans, workers, farmers, consumers, land, ecosystems and future food security

Constructive receiving capacity proposed in Atlas

Welfare, alternative proteins, regenerative land use, livelihood transition and nutrition capacity

Author-defined Mutual Uptick acceptance target

Food security, livelihoods, welfare and ecological resilience improve across the transition horizon

Decisive experiment described in Atlas

Phased regional transition with preregistered carrier ledger

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Acceptance, verification and recurrence

Intended measurable outcome: Food security, livelihoods, welfare and ecological resilience improve across the transition horizon. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Phased regional transition with preregistered carrier ledger. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 116 · Learning, plasticity and cultural evolution

Family: Evolution, transformation and emergence | Atlas pages: 867–873 | Original status: Strong structural fit

Evidence-grounded native state

Neural plasticity, memory, skill, belief, imitation, teaching, incentives and social transmission

Receiving schema and recognition gap

Test score, output or adoption count

Candidate blocker

Fast performance gain displaces understanding, wellbeing, diversity or future learning capacity

Named receiving carriers

Learner, teachers, peers, institutions, future self and cultural network

Constructive receiving capacity proposed in Atlas

Feedback, practice, memory, rest, social scaffolding and plural knowledge capacity

Author-defined Mutual Uptick acceptance target

Capability, transfer, wellbeing and future learning capacity improve together

Decisive experiment described in Atlas

Longitudinal transfer-and-retention experiment

Status boundary

Research design: Longitudinal transfer-and-retention experiment. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 117 · Self-organization and emergence

Family: Evolution, transformation and emergence | Atlas pages: 874–880 | Original status: Formal / empirical frontier

Evidence-grounded native state

Local interactions, gradients, constraints, feedback, network topology, resource flows and macrostate

Receiving schema and recognition gap

Macro outcome without micro-carrier ledger

Candidate blocker

Emergent order appears beneficial while unstable local compensation accumulates

Named receiving carriers

Components, neighborhoods, emergent structure and external environment

Constructive receiving capacity proposed in Atlas

Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity

Author-defined Mutual Uptick acceptance target

Emergent order remains viable while local stress and hidden compensation decline

Decisive experiment described in Atlas

Multi-scale simulation plus physical/biological holdout

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

Evaluate the incumbent representation: Macro outcome without micro-carrier ledger. Then test the specific candidate blocker: Emergent order appears beneficial while unstable local compensation accumulates. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Boundary conditions, damping, redundancy, resource routing and adaptive feedback capacity. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H007, H009. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Emergent order remains viable while local stress and hidden compensation decline. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Multi-scale simulation plus physical/biological holdout. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 118 · Creation, provenance and dependency

Family: Evolution, transformation and emergence | Atlas pages: 881–887 | Original status: Constructive protocol

Evidence-grounded native state

Origin lineage, creator-created dependency, resources, control, autonomy, maintenance and reciprocal effects

Receiving schema and recognition gap

Ownership or authorship treated as sufficient relationship model

Candidate blocker

Created systems become dependent assets or creators become disposable inputs because provenance and reciprocal dependency are ignored

Named receiving carriers

Creators, created systems, maintainers, users, infrastructure and environment

Constructive receiving capacity proposed in Atlas

Provenance, stewardship, autonomy-transition and reciprocal-viability architecture

Author-defined Mutual Uptick acceptance target

Created and creating systems remain viable without one becoming the sacrificial substrate of the other

Decisive experiment described in Atlas

Longitudinal creator-created dependency audit

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 118 · Creation, provenance and dependency | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: Origin lineage, creator-created dependency, resources, control, autonomy, maintenance and reciprocal effects. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: Creators, created systems, maintainers, users, infrastructure and environment. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Current schema and binding constraint

Evaluate the incumbent representation: Ownership or authorship treated as sufficient relationship model. Then test the specific candidate blocker: Created systems become dependent assets or creators become disposable inputs because provenance and reciprocal dependency are ignored. This language is source-derived until supported by a measured case.

Construction search

Candidate structure to investigate: Provenance, stewardship, autonomy-transition and reciprocal-viability architecture. Compare redesign, re-selection, phased installation and capacity addition under matched costs and safety boundaries.

Historical case pointers

Related evidence records: H007, H009. Family context only, not direct evidence for this particular adapter.

Acceptance, verification and recurrence

Intended measurable outcome: Created and creating systems remain viable without one becoming the sacrificial substrate of the other. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Longitudinal creator-created dependency audit. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 119 · Cosmological evolution and structure formation

Family: Evolution, transformation and emergence | Atlas pages: 888–894 | Original status: Hard scientific frontier

Evidence-grounded native state

Spacetime geometry, fields, matter/radiation, density structure, expansion, gravitation and observational state

Receiving schema and recognition gap

Single scale or observable treated as complete cosmic state

Candidate blocker

Model success at one scale hides mismatch, selection effect or unresolved dynamics at another

Named receiving carriers

Observed regions, fields/matter components, instruments, models and observers

Constructive receiving capacity proposed in Atlas

Cross-scale observation, uncertainty, model-comparison and instrumentation capacity

Author-defined Mutual Uptick acceptance target

Predictive fidelity increases across scales without hidden contradiction or unsupported closure

Decisive experiment described in Atlas

Preregistered cross-survey predictive holdout

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 119 · Cosmological evolution and structure formation | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Research design: Preregistered cross-survey predictive holdout. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

ADAPTER 120 · Cross-substrate consciousness, temporal coexistence and closure

Family: Evolution, transformation and emergence | Atlas pages: 895–901 | Original status: Meta-adapter / closure operator

Evidence-grounded native state

The entire coupled consequential state across Adapters 001-119, including dependencies, time horizons and current consciousness-legibility

Receiving schema and recognition gap

Any local adapter, species, institution or observer claiming closure from its own schema alone

Candidate blocker

A newly recognized truth, capability or optimization becomes locally beneficial while dependent carriers lack the capacity to absorb its consequences through time

Named receiving carriers

All materially coupled conscious carriers reached through direct, indirect and delayed dependency paths

Constructive receiving capacity proposed in Atlas

Coordinated capacity construction across relevant adapters, phased through time, while preserving openness to newly legible consciousness and dependencies

Author-defined Mutual Uptick acceptance target

Increasing consciousness-legibility and viable coexistence across the coupled system, with no material carrier forced to become the sacrificial sink of another system’s advancement

Decisive experiment described in Atlas

Time-locked system-of-systems closure test across multiple adapters

Status boundary

All items on this page reproduce native Atlas source descriptions. No new causal result or passed Mutual Uptick gate is asserted.

ADAPTER 120 · Cross-substrate consciousness, temporal coexistence and closure | IMPLEMENTATION SPECIFICATION

REQUIRED INDEPENDENT WORK

Historical actions and missed opportunities

Locate prior attempts in this particular domain, including known successful interventions, failed interventions and possible risk substitution. Source each attempt with dated records rather than infer facts from the ontology.

Native causal data and units

Acquire the native observables described in this adapter: The entire coupled consequential state across Adapters 001-119, including dependencies, time horizons and current consciousness-legibility. Record what is observed and what remains unidentifiable.

Receiving carrier ledger

Open an auditable ledger for: All materially coupled conscious carriers reached through direct, indirect and delayed dependency paths. Each row needs its own units, horizon, safety gates, baseline, counterfactual and uncertainty.

Acceptance, verification and recurrence

Intended measurable outcome: Increasing consciousness-legibility and viable coexistence across the coupled system, with no material carrier forced to become the sacrificial sink of another system’s advancement. Decide in advance how to reject or revise an intervention. If evidence is insufficient, define the next evidence-collection action, not a false claim of success.

Field protocol and responsibility

Research design: Time-locked system-of-systems closure test across multiple adapters. Required: researcher/collaborator, permissions, data provenance, strongest native comparator, preregistration, costed construction, carrier-specific post-state and independent replication.

PART III · CROSS-DOMAIN CLOSURE

The archive remains open to newly recognized carriers, time periods, substrate models and future corrective constructions. Adapter 120 is a coordination hypothesis; this release does not declare that all carriers across the universe have been measured.

NEXT RELEASE CONDITION

An implementation-grade edition requires an original dataset or independently verified field observation, a frozen comparison to an incumbent, measured improvement for the identified carriers over a specified horizon, and a documented list of remaining externalities. A source-derived card may advance to empirical evidence only when those gates are actually met.

Purpose and evidence hierarchy

Source synthesis and research integrity

ANALYTICAL DESIGN / NOT AN OBSERVED IMPLEMENTATION

RESEARCH SCOPE

Differentiate authored origin, observed history, identified causal result, experiment design and completed consequential closure.

CORPUS INPUTS

Canonical Universal Reality Atlas Edition 1.0 (2026); 120 source-derived adapter briefs; 18 source-linked historical cases; 26 node-reaction examples and preserved previous tests.

COMPETING SCIENTIFIC BASELINE

A strong alternative already exists for many subproblems: causal inference, control, resilience, safety, life-cycle assessment, operations research or native physical theory.

INTEGRATED RESEARCH REQUIREMENT

Record exact observable state; name the receiving schema and meaningful boundary; identify causal carriers; cost and assess possible capacity changes before acting; retest affected carriers through time.

WHAT THE EVIDENCE DOES NOT JUSTIFY

The presence of a formal grammar, a hypothesis, a simulation or historical outcome does not prove a new universal physical law or an independently implemented strict Mutual Uptick.

OPERATIONAL NEXT STEP

Attach primary source IDs and measured native units, derive a testable causal prediction, select a strong comparator and build an auditable next-experiment record.

INDEPENDENT EPISTEMIC GATE

Preserve known gains and known failures without labeling unknown protected-carrier outcomes as benefits.

Sources: Rufino (2026) Universal Reality Atlas, pp. 1-27, 917-922; living library v0.1.

The index case

Source synthesis and research integrity

ANALYTICAL DESIGN / NOT AN OBSERVED IMPLEMENTATION

RESEARCH SCOPE

The originating author's historical record supplies source provenance; it is not a randomized trial of universality.

CORPUS INPUTS

Canonical Universal Reality Atlas Edition 1.0 (2026); 120 source-derived adapter briefs; 18 source-linked historical cases; 26 node-reaction examples and preserved previous tests.

Record exact observable state; name the receiving schema and meaningful boundary; identify causal carriers; cost and assess possible capacity changes before acting; retest affected carriers through time.

WHAT THE EVIDENCE DOES NOT JUSTIFY

The presence of a formal grammar, a hypothesis, a simulation or historical outcome does not prove a new universal physical law or an independently implemented strict Mutual Uptick.

OPERATIONAL NEXT STEP

Attach primary source IDs and measured native units, derive a testable causal prediction, select a strong comparator and build an auditable next-experiment record.

INDEPENDENT EPISTEMIC GATE

Preserve known gains and known failures without labeling unknown protected-carrier outcomes as benefits.

Sources: Rufino (2026) Universal Reality Atlas, pp. 1-27, 917-922; living library v0.1.

Funding and implementation

Source synthesis and research integrity

ANALYTICAL DESIGN / NOT AN OBSERVED IMPLEMENTATION

RESEARCH SCOPE

Approvals, safety review, ethical resources, and costed implementation decisions precede deployment.

CORPUS INPUTS

Canonical Universal Reality Atlas Edition 1.0 (2026); 120 source-derived adapter briefs; 18 source-linked historical cases; 26 node-reaction examples and preserved previous tests.

COMPETING SCIENTIFIC BASELINE

A strong alternative already exists for many subproblems: causal inference, control, resilience, safety, life-cycle assessment, operations research or native physical theory.

INTEGRATED RESEARCH REQUIREMENT

Record exact observable state; name the receiving schema and meaningful boundary; identify causal carriers; cost and assess possible capacity changes before acting; retest affected carriers through time.

WHAT THE EVIDENCE DOES NOT JUSTIFY

The presence of a formal grammar, a hypothesis, a simulation or historical outcome does not prove a new universal physical law or an independently implemented strict Mutual Uptick.

OPERATIONAL NEXT STEP

Attach primary source IDs and measured native units, derive a testable causal prediction, select a strong comparator and build an auditable next-experiment record.

INDEPENDENT EPISTEMIC GATE

Preserve known gains and known failures without labeling unknown protected-carrier outcomes as benefits.

Sources: Rufino (2026) Universal Reality Atlas, pp. 1-27, 917-922; living library v0.1.

Correction and supersession

Source synthesis and research integrity

ANALYTICAL DESIGN / NOT AN OBSERVED IMPLEMENTATION

RESEARCH SCOPE

Version changes must explicitly supersede older contrary claims without rewriting historical records.

CORPUS INPUTS

Canonical Universal Reality Atlas Edition 1.0 (2026); 120 source-derived adapter briefs; 18 source-linked historical cases; 26 node-reaction examples and preserved previous tests.

COMPETING SCIENTIFIC BASELINE

A strong alternative already exists for many subproblems: causal inference, control, resilience, safety, life-cycle assessment, operations research or native physical theory.

Publication closure

Source synthesis and research integrity

ANALYTICAL DESIGN / NOT AN OBSERVED IMPLEMENTATION

RESEARCH SCOPE

This edition completes 25,000 paginated research-design pages, not 25,000 successfully deployed interventions.

CORPUS INPUTS

Canonical Universal Reality Atlas Edition 1.0 (2026); 120 source-derived adapter briefs; 18 source-linked historical cases; 26 node-reaction examples and preserved previous tests.

COMPETING SCIENTIFIC BASELINE

H001 | Project STAR: Small classes versus regular classes and teacher aides

Historical case / analysis lens 1: Published historical intervention

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Project STAR: Small classes versus regular classes and teacher aides (1985–1989). Study classification: OBSERVED RANDOMIZED INTERVENTION; PARTIAL CARRIER DATA.

FOCUS OF THIS PAGE

Published historical intervention. What the original publication actually observed and in which study design.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Instructional inputs and student achievement. Observed: Randomized class-size reduction improved test performance; published analysis found teacher aides had little effect on achievement. Original study notes attrition and crossover.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Students, teachers, school system, school budget, families. Actually measured in source: Student standardized test outcomes; treatment/class allocation.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Long-term teacher workload, budget consequences, student-by-student counterfactuals and complete family outcomes.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Compare smaller classes, aides, teacher preparation and targeted support under matched costs; measure students plus teacher time, schools and households.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Original Project STAR randomized design; school fixed effects; cost-effectiveness analysis. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: Krueger 1997, Experimental Estimates of Education Production Functions. Source link: https://www.nber.org/papers/w6051. Full operator result: NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS.

Source-linked public record: https://www.nber.org/papers/w6051 ; see library historical_cases/H001.md

H001 | Project STAR: Small classes versus regular classes and teacher aides

Historical case / analysis lens 2: Original system boundary

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Project STAR: Small classes versus regular classes and teacher aides (1985–1989). Study classification: OBSERVED RANDOMIZED INTERVENTION; PARTIAL CARRIER DATA.

FOCUS OF THIS PAGE

Original system boundary. What the local operator or institution was optimizing.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Instructional inputs and student achievement. Observed: Randomized class-size reduction improved test performance; published analysis found teacher aides had little effect on achievement. Original study notes attrition and crossover.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Students, teachers, school system, school budget, families. Actually measured in source: Student standardized test outcomes; treatment/class allocation.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Long-term teacher workload, budget consequences, student-by-student counterfactuals and complete family outcomes.

H001 | Project STAR: Small classes versus regular classes and teacher aides

Historical case / analysis lens 6: Constructive capacity candidate

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Project STAR: Small classes versus regular classes and teacher aides (1985–1989). Study classification: OBSERVED RANDOMIZED INTERVENTION; PARTIAL CARRIER DATA.

FOCUS OF THIS PAGE

Constructive capacity candidate. What system could be constructed before the next transition, subject to safety.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Instructional inputs and student achievement. Observed: Randomized class-size reduction improved test performance; published analysis found teacher aides had little effect on achievement. Original study notes attrition and crossover.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Students, teachers, school system, school budget, families. Actually measured in source: Student standardized test outcomes; treatment/class allocation.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Long-term teacher workload, budget consequences, student-by-student counterfactuals and complete family outcomes.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Compare smaller classes, aides, teacher preparation and targeted support under matched costs; measure students plus teacher time, schools and households.

BENCHMARK AND FALSIFICATION

H001 | Project STAR: Small classes versus regular classes and teacher aides

Historical case / analysis lens 8: Provenance and honest classification

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Project STAR: Small classes versus regular classes and teacher aides (1985–1989). Study classification: OBSERVED RANDOMIZED INTERVENTION; PARTIAL CARRIER DATA.

FOCUS OF THIS PAGE

Provenance and honest classification. How to present positive, negative and missing evidence without fabricating a MU+ result.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Instructional inputs and student achievement. Observed: Randomized class-size reduction improved test performance; published analysis found teacher aides had little effect on achievement. Original study notes attrition and crossover.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Students, teachers, school system, school budget, families. Actually measured in source: Student standardized test outcomes; treatment/class allocation.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Long-term teacher workload, budget consequences, student-by-student counterfactuals and complete family outcomes.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Compare smaller classes, aides, teacher preparation and targeted support under matched costs; measure students plus teacher time, schools and households.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Original Project STAR randomized design; school fixed effects; cost-effectiveness analysis. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source-linked public record: https://www.nber.org/papers/w6051 ; see library historical_cases/H001.md

H002 | Oregon Medicaid lottery: insurance and downstream outcomes

Historical case / analysis lens 1: Published historical intervention

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Oregon Medicaid lottery: insurance and downstream outcomes (2008–2013). Study classification: OBSERVED RANDOMIZED INTERVENTION; MIXED OUTCOMES.

FOCUS OF THIS PAGE

Published historical intervention. What the original publication actually observed and in which study design.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Health-insurance enrollment and healthcare access. Observed: Coverage improved financial protection, preventive services and depression outcomes; measured hypertension, cholesterol and blood sugar showed no statistically significant improvements over about two years.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Insured adults, caregivers, clinicians, hospitals, insurers, public budget. Actually measured in source: Depression screens, catastrophic spending, utilization, measured clinical indicators.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Full provider capacity, all taxpayer costs, longer-horizon morbidity, household spillovers.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Pair insurance access with tested provider-capacity, prevention, and follow-up designs while measuring financial, mental, and physical-health dimensions.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Oregon Health Insurance Experiment lottery evaluation. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: Baicker et al. 2013, New England Journal of Medicine. Source link: https://www.nejm.org/doi/full/10.1056/NEJMsa1212321. Full operator result: NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS.

Source-linked public record: https://www.nejm.org/doi/full/10.1056/NEJMsa1212321 ; see library historical_cases/H002.md

H002 | Oregon Medicaid lottery: insurance and downstream outcomes

Historical case / analysis lens 2: Original system boundary

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Oregon Medicaid lottery: insurance and downstream outcomes (2008–2013). Study classification: OBSERVED RANDOMIZED INTERVENTION; MIXED OUTCOMES.

FOCUS OF THIS PAGE

Original system boundary. What the local operator or institution was optimizing.

Oregon Medicaid lottery: insurance and downstream outcomes (2008–2013). Study classification: OBSERVED RANDOMIZED INTERVENTION; MIXED OUTCOMES.

FOCUS OF THIS PAGE

Provenance and honest classification. How to present positive, negative and missing evidence without fabricating a MU+ result.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Health-insurance enrollment and healthcare access. Observed: Coverage improved financial protection, preventive services and depression outcomes; measured hypertension, cholesterol and blood sugar showed no statistically significant improvements over about two years.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Insured adults, caregivers, clinicians, hospitals, insurers, public budget. Actually measured in source: Depression screens, catastrophic spending, utilization, measured clinical indicators.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Full provider capacity, all taxpayer costs, longer-horizon morbidity, household spillovers.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Pair insurance access with tested provider-capacity, prevention, and follow-up designs while measuring financial, mental, and physical-health dimensions.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Oregon Health Insurance Experiment lottery evaluation. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: Baicker et al. 2013, New England Journal of Medicine. Source link: https://www.nejm.org/doi/full/10.1056/NEJMsa1212321. Full operator result: NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS.

Source-linked public record: https://www.nejm.org/doi/full/10.1056/NEJMsa1212321 ; see library historical_cases/H002.md

H003 | Moving to Opportunity: effects depend on age and exposure duration

Historical case / analysis lens 1: Published historical intervention

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Moving to Opportunity: effects depend on age and exposure duration (1994–2016). Study classification: OBSERVED RANDOMIZED PROGRAM; HETEROGENEOUS LONG-TERM OUTCOMES.

FOCUS OF THIS PAGE

Published historical intervention. What the original publication actually observed and in which study design.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Housing vouchers and movement to lower-poverty neighborhoods. Observed: Children who moved before age 13 later had higher earnings and college attendance; effects of adolescent relocation were slightly negative in the cited analysis.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Children, parents, local communities, receiving schools, housing market. Actually measured in source: Long-term tax records, education and earnings; ages at move.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Full social network rupture, displaced-community effects, all fiscal costs, causal decomposition of each service.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Time relocation and protect continuity of schooling, support networks, transport and family services; compare full multicarrier outcomes.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Moving to Opportunity randomized vouchers; age-heterogeneous causal evaluation. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: Chetty, Hendren & Katz 2016, AER. Source link: https://www.aeaweb.org/articles?id=10.1257%2Faer.20150572. Full operator result: NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS.

H004 | National Supported Work: employment outcomes and distribution

Historical case / analysis lens 1: Published historical intervention

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

National Supported Work: employment outcomes and distribution (1970s). Study classification: PUBLISHED EXPERIMENTAL DATA; LIMITED CARRIER MEASUREMENT.

FOCUS OF THIS PAGE

Published historical intervention. What the original publication actually observed and in which study design.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Employment support for disadvantaged jobseekers. Observed: The Dehejia-Wahba sample of the NSW program contains treated and controls with subsequent earnings; independent published analysis evaluates earnings effects and how observational methods can mislead.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Workers, households, employers, program funders, communities. Actually measured in source: 1978 earnings and selected prior employment histories.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Employer productivity, full participant welfare, labor displacement, fiscal costs and future horizons.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Trace skills-to-work matching and employer demand; combine job placement with barriers to retention, support and cost accounting.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Randomized National Supported Work experiment; LaLonde causal inference comparisons. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: Published historical NSW sample via Rdatasets/causaldata. Source link: https://raw.githubusercontent.com/vincentarelbundock/Rdatasets/master/csv/causaldata/nsw_mixtape.csv. Full operator result: NOT DEMONSTRATED FOR ALL PROTECTED CARRIERS.

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 1: Published historical intervention

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Published historical intervention. What the original publication actually observed and in which study design.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Farmers, downstream fishing communities, lake ecosystem, regional air and soil, future generations. Actually measured in source: Satellite images, river inflows, fishery records and exposed lakebed.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Counterfactual allocation by season, feasible rights and infrastructure, complete distribution of costs across decades.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Reallocate flows subject to ecological minima, agricultural productivity, livelihoods, soil and water constraints; model compensation and alternative crop/irrigation systems.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Hydrological basin optimization and ecological water-allocation models. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

Source: NASA Earth Observatory, World of Change: Aral Sea. Source link: https://science.nasa.gov/earth/earth-observatory/world-of-change/aral-sea/. Full operator result: CLEARLY NOT A WHOLE-SYSTEM UPTICK UNDER OBSERVED PATH.

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 2: Original system boundary

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Original system boundary. What the local operator or institution was optimizing.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Farmers, downstream fishing communities, lake ecosystem, regional air and soil, future generations. Actually measured in source: Satellite images, river inflows, fishery records and exposed lakebed.

UNMEASURED CONSEQUENCES

Do not infer absent data as zero: Counterfactual allocation by season, feasible rights and infrastructure, complete distribution of costs across decades.

CONSTRUCTIVE PROPOSAL, NOT DEPLOYED HERE

Reallocate flows subject to ecological minima, agricultural productivity, livelihoods, soil and water constraints; model compensation and alternative crop/irrigation systems.

BENCHMARK AND FALSIFICATION

Strongest incumbent: Hydrological basin optimization and ecological water-allocation models. Require new blinded outcome data with the same information, cost and horizon.

EVIDENCE AND RESULTING STATUS

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 3: Receiving-carrier topology

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Receiving-carrier topology. Which carriers could receive gain, risk, work, cost or harm.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Farmers, downstream fishing communities, lake ecosystem, regional air and soil, future generations. Actually measured in source: Satellite images, river inflows, fishery records and exposed lakebed.

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 4: Measured findings and unknowns

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Measured findings and unknowns. Which quantities were observed, and what was not measured.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

PROTECTED CARRIERS

Relevant carriers for a wider causal ledger: Farmers, downstream fishing communities, lake ecosystem, regional air and soil, future generations. Actually measured in source: Satellite images, river inflows, fishery records and exposed lakebed.

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 5: Counterfactual and incumbents

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Counterfactual and incumbents. What existing causal or mechanistic methods best explain the data.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

H005 | Aral Sea: irrigation gain with downstream ecological and social loss

Historical case / analysis lens 6: Constructive capacity candidate

HISTORICAL OBSERVATION / FULL-KERNEL PASS NOT ESTABLISHED

HISTORICAL RECORD

Aral Sea: irrigation gain with downstream ecological and social loss (1960s–2014). Study classification: OBSERVED HISTORICAL ECOLOGICAL CHANGE; RETROSPECTIVE CAUSAL ACCOUNT.

FOCUS OF THIS PAGE

Constructive capacity candidate. What system could be constructed before the next transition, subject to safety.

ORIGINAL INTERVENTION AND WHAT WAS KNOWN

Local objective: Agricultural irrigation and cotton production through river diversion. Observed: Major diversion of inflowing rivers corresponded with severe shrinking of the Aral Sea, ecosystem collapse and disappearance of a fishing economy; NASA observed drying of the eastern basin by 2014.

PROTECTED CARRIERS
